2. Computational Section.

All calculations included in this paper were carried out using the GAUSSIAN 09¹ series of programs. In order to include electron correlation at a reasonable computational cost, Density Functional Theory (DFT)² was used. Some of these calculations were carried out by means of the three-parameter functional developed by Becke,³ which is usually denoted as B3LYP, with the standard 6-31G* basis set.⁴ Other ones, were performed using the hybrid meta exchange-correlation MPWB1K density functional⁵ developed by Truhlar and the 6-31** basis set.⁶

Initially, the geometry of compounds **1** and **2** were optimized at B3LYP/6-31G* (Figure S6), and the corresponding electrostatic potential maps were computed (Figure S8). The presence of the aromatic units and the long peripheral paraffinic chains in compounds **1** and **2** should favor the formation of organized supramolecular structures by the operation of $\pi-\pi$ stacking and van der Waals interactions. Moreover, the charge distribution showed in the electrostatic potential maps indicated that the triazole rings should be alternated in the supramolecular assembly, in order to avoid the electrostatic interaction. To modelized the supramolecular assembly, we chosed a simplified structure in order to minimized the computational cost. In the monomer **1** the pedant dodecyl chains were replaced for metoxy groups. The widely used Becke's three-parameters B3LYP funtional is not adecuate to calculate the formation of supramolecular aggregates because it fails in describing dispersion forces and does not properly account for stacking $\pi-\pi$ interactions. For these reason is necesary the employment the MPWB1K funtional. Truhlar et al. have reported a very comprehensive study on a large data base of non-covalent interacting systems using different funtionals and concluded that the MPW1BK gives good performance for $\pi-\pi$ stacking interactions and intermolecular hydrogen bonds using moderate basis sets. Recently, some authors have been employed succesfully this funtional.⁷ The optimized monomer was used in a second step to generate the dimer. At this point it had performed an optimization of intermolecular distance and the rotation angle for two triazol rings. Single points calculations for diferents values were carried out. All the results are showed in Figure S9.

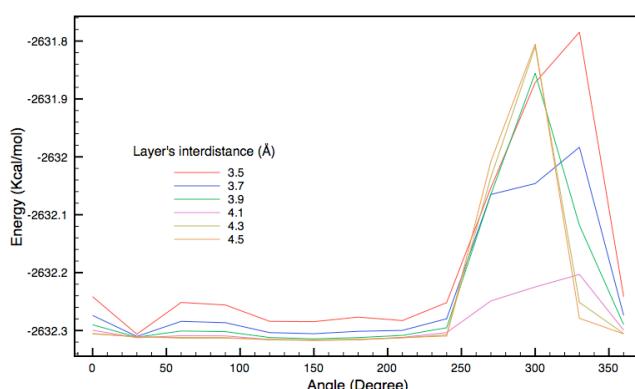

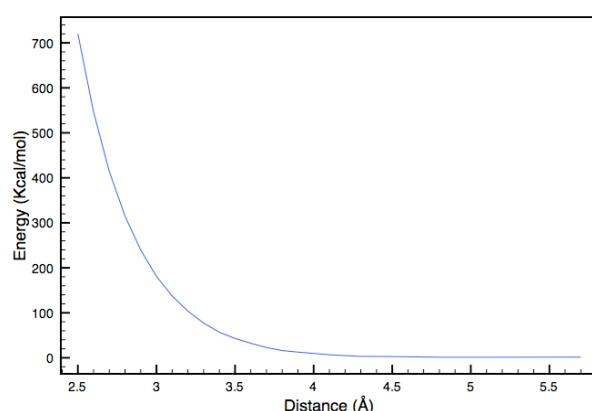

Figure S9. a) Intermolecular distance optimization. b) Torsion intermolecular angle optimization.

The optimal intermolecular distante between two monomers was 2.7 Å and the rotation angle was 150° . Taken in account these results, the trimer was generated in two diferent dispositions, trimer **A** and **B**. In trimer **A**, the triazol ring of the third unit was rotated 150° about the perpendicular axis to the molecular plane, possessing a similar disposition to unit 1. On the contrary, in trimer **B** the third unit was rotated 150° in the same direction than that of the second unit, resulting in a helical organization. For the tetramer we considered again the same both dispositions. The geometries of all trimers and tetramers were fully relaxed. The optimized structures of both tetramers are shown in Figure S7. The obtained results indicated that the tetramer **A** is 9 kcal/mol more stable than tetramer **B**. A plausible explanation for this could be the existence of a threefold intermolecular hydrogen bonding between the N-1 and the *o*-H of the substituted phenyl at N-4. Moreover, the stabilization energy (in kcal/mol) per monomer unit for each supramolecular structure was computed. These energies are collected in Table S1.

Table S1

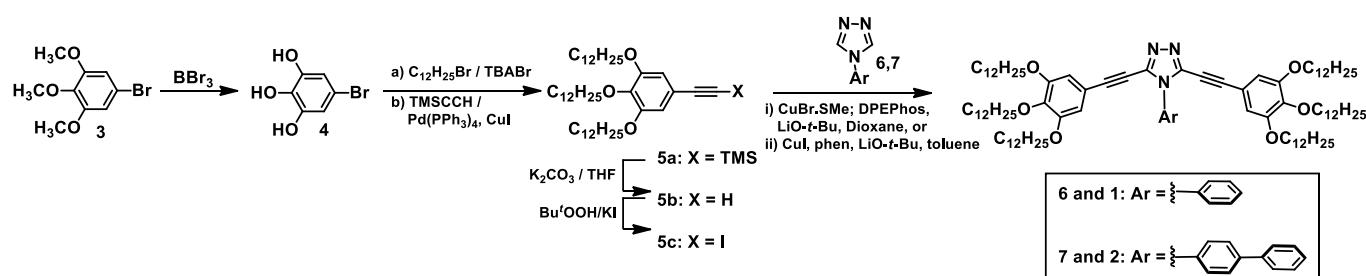

Structure	MPWB1K/6-31G**	MPWB1K/6-31G**// MPWB1K/cc-pVTZ
Monomer	0,00	0,00
Dimer	-12,12	-9,61
Trimer	-27,08	-20,44
Tetramer	-34,11	-25,02

These values possess a basis set superposition error (BSSE),⁸ which is always present in a supramolecular calculation of interacting molecular fragments. It has been recently shown that the best way of dealing with the BSSE is not to use CP corrections,⁹ which usually overcorrects for BSSE, but to make a computational effort by increasing the basis set. For this reason, the total energies for the aggregates were recalculated using MPWB1K/6-31G**// MPWB1K/cc-pVTZ. The employment of this more extended cc-pVTZ basis set¹⁰ led to a decrease of the BSSE near to 17-19%.

3. Experimental section

General. Commercially available reagents were used without further purification. Microwave irradiations were performed in a Discover® (CEM) focused microwave reactor. Yields refer to isolated and purified products. Reactions were monitored by thin-layer chromatography carried out on silica gel plates (60F-254) visualized under UV light. Column chromatography was performed on silica gel 60, (230-400 mesh). ^1H - and ^{13}C -NMR spectra were recorded on a Varian Unity 500 or on a Bruker Avance 300 spectrometers at 298 K. Chemical shifts are reported in ppm (δ) using Me4Si as the internal reference and coupling constants J are given in Hz. MALDI-TOF mass spectra were measured with a Bruker Autoflex II TOF/TOF spectrometer (Bremen, Germany) by using dithranol as the matrix. Samples co-crystallized with the matrix on the probe were ionized with a nitrogen laser pulse (337 nm) and accelerated under 20 kV with time-delayed extraction before entering the time-of-flight mass spectrometer. Matrix (10 mg/mL) and sample (1 mg/mL) were separately dissolved in methanol and mixed in a matrix/sample ratio ranging from 100:1 to 50:1. Typically, a 5 μL mixture of matrix and sample was applied to a MALDI-TOF MS probe and air-dried. MALDITOF MS in positive reflector mode was used for all samples. External calibration was performed by using Peptide Calibration Standard II (covered mass range: 700–3200 Da), Protein Calibration Standard I (covered mass range: 5000–17500 Da) and Protein Calibration Standard II (covered mass range: 20000– 70000 Da) from Care (Bruker). The applied peak (m/z determination) detection method was the threshold centroid at 50% height of the peak maximum. SEM images were obtained from on a JEOL JSM 6335F microscope working at 10kV. Fluorescence images were recorded on a Leica TCE SP2 confocal microscope.
