General Consideration:

Reagent Information. Unless otherwise stated, all reactions were carried out under air in screw cap reaction tubes. All the solvents were bought from Aldrich in sure-seal bottle and were used as received. tert-butylnitrite and TEMPO were purchased from Aldrich. Molecular sieves (4Å; particle size 2–3 µ) were bought from Aldrich. Molecular sieves were always kept in oven in small amount before use. All the cinnamic acids were bought from Aldrich and alfaAesar. For column chromatography, silica gel (60–120 mesh or 100–200 mesh) obtained from SRL Co. were used. A gradient elution using pet ether and ethyl acetate was performed, based on Merck aluminium TLC sheets (silica gel 60F254).

Analytical Information. All isolated compound are characterized by 1H NMR, 13C NMR spectroscopy and Gas chromatography mass spectra (GC–MS). Copies of the 1H NMR, 13C NMR can be found in the Supporting Information. Unless otherwise stated, all Nuclear Magnetic Resonance spectra were recorded on a Bruker 400 MHz instrument. Some Nuclear Magnetic Resonance was taken on a Varian 400 MHz instrument. All 1H NMR experiments are reported in units, parts per million (ppm), and were measured relative to the signals for residual chloroform (7.26 ppm) in the deuterated solvent, unless otherwise stated. All 13C NMR spectra were reported in ppm relative to deuterochloroform (77.23 ppm), unless otherwise stated, and all were obtained with 1H decoupling. All GC analyses were performed on a Agilent 7890A GC system with an FID detector using a J & W DB–1 column (10 m, 0.1 mm I.D.) using n-decane as the internal standard. All GCMS analysis was done by Agilent 7890A GC system connected with 5975C inert XL EI/C1 MSD (with triple axis detector). Melting point of the compounds was determined using a BuChi B-545 melting point apparatus.

Description of Reaction Tube:

**General Procedure** for nitration of Cinnamic acids with $t$BuONO and TEMPO under air using CH$_3$CN as the solvent.

An oven-dried screw cap test tube was charged with a magnetic stir-bar, TEMPO (0.2 mmol, 32 mg) and cinnamic acid derivative (0.25 mmol) under air atmosphere. $t$BuONO (0.5 mmol, 60 µL) and the solvent (MeCN, 1 mL) were added by microliter syringe and laboratory syringe respectively. The reaction tube was placed in a preheated oil bath at 50 ºC and the reaction mixture was stirred vigorously for 3-24h. Then the reaction mixture was cooled to room temperature. The reaction mixture was filtered through a celite bed filter. Celite bed was washed with ethyl acetate as the washing solvent. Finally organic extract was concentrated and was purified by column chromatography using silica gel column (60-120/100-200 mesh size) and petroleum-ether / ethyl acetate as the eluent.

**Characterization Data of Synthesized Nitroolefins:**
(E)-1-methoxy-2-(2-nitrovinyl) benzene (Table 2, entry 2a).\textsuperscript{1} Nitration was done by the general procedure with (E)-3-(4-methoxyphenyl) acrylic acid (0.25mmol, 45 mg) as the substrate. Pure nitrated product was isolated by column chromatography through a silica gel column (mesh 60–120). Eluent: ethyl acetate/ petroleum ether (2:98 v/v); crystalline (needle shape) yellow solid; isolated yield: 95% (43 mg). ¹H NMR (400 MHz, Chloroform-d) δ 3.86 (s, 3H), 6.92 – 6.97 (d, J = 8.8 Hz, 2H), 7.47 – 7.53 (m, 3H), 7.92 – 7.98 (d, J = 13.6 Hz, 1H). ¹³C NMR (101 MHz, Chloroform-d) δ 55.59, 114.97, 122.54, 131.28, 135.00, 139.13, 163.02. GC-MS (m/z): 179.1 [M]⁺. M. Pt. 89-92 °C (CHCl₃); Lit: 86 °C (EtOH)\textsuperscript{10}.

(E)-1,2-dimethoxy-4-(2-nitrovinyl)benzene (Table 2, entry 2b).\textsuperscript{7} Nitration was done by the general procedure with (E)-3-(3,4-dimethoxyphenyl) acrylic acid (0.25mmol, 52 mg) as the substrate. Pure nitrated product was isolated by column chromatography through a silica gel column (mesh 60–120). Eluent: ethyl acetate/ petroleum ether (2:98 v/v); crystalline (plate shape) yellow solid; isolated yield: 87% (43.5 mg). ¹H NMR (400 MHz, Chloroform-d) δ 3.93 (s, 3H), 3.95 (s, 3H), 6.87 – 6.97 (d, J = 8.3 Hz, 1H), 6.99 – 7.04 (d, J = 2.0 Hz, 1H), 7.14 – 7.20 (dd, J = 8.4, 1.9 Hz, 1H), 7.51 – 7.57 (d, J = 13.6 Hz, 1H), 7.90 – 7.95 (d, J = 13.6 Hz, 1H). ¹³C NMR (101 MHz, CDCl₃) δ 56.21, 56.30, 110.40, 111.52, 111.53, 124.83, 124.85, 135.35, 135.36, 139.52. GC-MS (m/z): 209.1 [M]⁺. M. Pt. 138 °C (CHCl₃); Lit: 144.5 °C (EtOH)\textsuperscript{11}.

(E)-1,2,3-trimethoxy-5-(2-nitrovinyl)benzene (Table 2, entry 2c).\textsuperscript{1} Nitration was done by the general procedure with (E)-3-(3,4,5-trimethoxyphenyl) acrylic acid (0.25mmol, 60mg) as the substrate. Pure nitrated product was isolated by column chromatography through a silica gel column (mesh 60–120). Eluent: ethyl acetate/ petroleum ether (5:95 v/v); yellow solid powder; isolated yield: 80% (48 mg). ¹H NMR (400 MHz, Chloroform-d) δ 3.89 (s, 3H), 3.90 (s, 3H), 6.74 – 6.78 (s, 2H), 7.51 – 7.57 (d, J = 13.6 Hz, 1H), 7.90 – 7.95 (d, J = 13.6 Hz, 1H). ¹³C NMR (101 MHz, CDCl₃) δ 56.44, 61.24, 100.15, 106.55, 125.47, 136.53, 139.51, 141.87, 153.83. GC-MS (m/z): 239.1 [M]⁺. M. Pt. 121 °C (CHCl₃).

(E)-1-methyl-4-(2-nitrovinyl) benzene (Table 2, entry 2d).\textsuperscript{2} Nitration was done by the general procedure with p-methylcinnamic acid (0.25mmol, 41 mg) as the substrate. Pure nitrated product was isolated by column chromatography through a silica gel column (mesh 60–120).
Eluent: ethyl acetate/ petroleum ether (1:99 v/v); yellow solid; isolated yield: 77% (31 mg). \(^1\)H NMR (400 MHz, Chloroform-d) δ 2.43(s, 3H), 7.25 – 7.30 (m, 2H), 7.44 – 7.48 (m, 2H), 7.55 – 7.61 (d, J = 13.7 Hz, 1H), 7.97 – 8.03 (d, J = 13.6 Hz, 1H). \(^{13}\)C NMR (101 MHz, CDCl_3) δ 21.84, 127.41, 129.36, 130.30, 136.41, 139.35, 143.29.GC-MS (m/z): 163.10 [M]+. M. Pt. 106 °C (CHCl_3); Lit : 108 °C.

\[
\text{Z)-(2-nitroprop-1-enyl) benzene (Table 2, entry 2e).}^4 \text{ Nitration was done by the general procedure with (E)-2-methyl-3-phenylacrylic acid (0.25mmol, 41 mg) as the substrate. Pure nitrated product was isolated by column chromatography through a silica gel column (mesh 60–120). Eluent: ethyl acetate/ petroleum ether (1:99 v/v); yellow liquid; isolated yield: 72% (29 mg)[E:Z = 4:1]. \(^1\)H NMR (400 MHz, Chloroform-d) δ 2.45 (d, J = 1.1 Hz, 3H), 7.39 – 7.49 (m, 5H), 8.08 – 8.11 (m, 1H). \(^{13}\)C NMR (101 MHz, CDCl_3) δ 14.24, 129.09, 130.11, 130.15, 132.59, 133.76, 147.92. GC-MS (m/z): 163.08 [M]+.

Pure nitrated product was isolated by column chromatography through a silica gel column (mesh 60–120). Eluent: ethyl acetate/ petroleum ether (2:98 v/v); yellow solid; isolated yield: 34\% (33 mg). \textsuperscript{1}H NMR (400 MHz, Chloroform-d) δ 7.66 – 7.72 (m, 2H), 7.89 (d, J = 7.9 Hz, 1H), 8.06 (d, J = 13.8 Hz, 1H), 8.34 – 8.37 (ddd, J = 8.2, 2.2, 1.0 Hz, 1H), 8.43 (t, J = 2.0, 2.0 Hz, 1H); \textsuperscript{13}C NMR (100 MHz, CDCl\textsubscript{3}) δ 123.66, 126.39, 130.80, 131.97, 134.65, 136.45, 139.44, 148.95. GC-MS (m/z): 194.1 [M]+; M. Pt. 126 °C (CHCl\textsubscript{3}); Lit:125 °C\textsuperscript{8}.

(E)-4-(2-nitrovinyl) benzonitrile (Table 2, entry 2o) \textsuperscript{8}. Nitration was done by general procedure with (E)-3-(4-cyanophenyl) acryl acid (0.25 mmol, 43.25 mg) as the substrate. Pure nitrated product was isolated by column chromatography through a silica gel column (mesh 60–120). Eluent: ethyl acetate/ petroleum ether (2:98 v/v); yellow solid; isolated yield: 36\% (16.5 mg). \textsuperscript{1}H NMR (400 MHz, Chloroform-d) δ 7.62 (d, J = 13.8 Hz, 1H), 7.67 (d, J = 8.4 Hz, 2H), 7.72 – 7.80 (m, 2H), 7.99 (d, J = 13.7 Hz, 1H); \textsuperscript{13}C NMR (100 MHz, CDCl\textsubscript{3}) δ 115.32, 117.96, 129.56, 133.17, 134.48, 136.75, 139.61.GC-MS (m/z): 174.1 [M]+; M. Pt. 185 °C (CHCl\textsubscript{3}); Lit:187 °C\textsuperscript{12}.

(E)-4-(2-nitrovinyl)dibeno[b,d]furan (Table 3, entry 3a).\textsuperscript{8} Nitration was done by the general procedure with (E)-3-(dibenzo[b,d]furan-4-yl)acryl acid(0.25mmol, 59 mg) as the substrate. Pure nitrated product was isolated by column chromatography through a silica gel column (mesh 60–120). Eluent: ethyl acetate/ petroleum ether (1:99 v/v); yellow solid; isolated yield: 78\% (47 mg). \textsuperscript{1}H NMR (400 MHz, Chloroform-d) δ 7.39 – 7.48 (m, 2H), 7.52 – 7.61 (m, 2H), 7.66 – 7.72 (d, J = 8.4 Hz, 1H), 7.97 – 8.03 (m, 1H), 8.06 – 8.11 (dd, J = 7.7, 1.3 Hz, 1H), 8.19 – 8.25 (d, J = 13.6 Hz, 1H), 8.34 – 8.41 (d, J = 13.6 Hz, 1H); \textsuperscript{13}C NMR (101 MHz, Chloroform-d) δ 112.18, 115.47, 121.06, 123.24, 123.60, 123.86, 124.48, 125.52, 128.27, 130.66, 134.36, 139.91, 154.44, 156.21. GC-MS (m/z): 239.06 [M]+; M. Pt. 123 °C (CHCl\textsubscript{3}); Lit: 124 °C\textsuperscript{8}.
(E)-3-(2-nitrovinyl)benzo[b]thiophene (Table 3, entry 3b). Nitration was done by the general procedure with (E)-3-(benzo[b]thiophen-3-yl)acrylic acid (0.25mmol, 51 mg) as the substrate. Pure nitrated product was isolated by column chromatography through a silica gel column (mesh 60–120). Eluent: ethyl acetate/ petroleum ether (1:99 v/v); yellow solid; isolated yield: 81% (41mg). \(^1\)H NMR (400 MHz, Chloroform-d) δ 7.45 – 7.57 (m, 2H), 7.74 – 7.80 (d, J = 13.8 Hz, 1H), 7.91 – 7.99 (m, 3H), 8.27 – 8.33 (d, J = 13.8, 1H). \(^1^3\)C NMR (101 MHz, CDCl\(_3\)) δ 122.23, 123.54, 125.90, 125.92, 127.30, 131.32, 133.09, 136.60, 136.89, 140.71. GC-MS (m/z): 205.02 [M]+. M. Pt. 112–113 °C (CHCl\(_3\)); Lit: 113 °C. 

(E)-2-(2-nitrovinyl) thiophene (Table 3, entry 3c). Nitration was done by the general procedure with (E)-3-(thiophen-2-yl)acrylic acid (0.25mmol, 38 mg) as the substrate. Pure nitrated product was isolated by column chromatography through a silica gel column (mesh 60–120). Eluent: ethyl acetate/ petroleum ether (1:99 v/v); orange yellow solid; isolated yield: 54% (21 mg). \(^1\)H NMR (400 MHz, Chloroform-d) δ 7.13 – 7.18 (dd, J = 5.1, 3.7 Hz, 1H), 7.45 – 7.48 (m, 2H), 7.49 – 7.52 (s, 1H), 7.55 – 7.59 (dt, J = 5.0, 1.0, 1.0 Hz, 1H), 8.13 – 8.19 (d, J = 13.4, 1H). \(^1^3\)C NMR (101 MHz, CDCl\(_3\)) δ 129.08, 131.82, 132.31, 133.97, 134.86, 135.55. M. Pt. 75 °C (CHCl\(_3\)); Lit: 79 °C (Ethanol). 

(E)-3-methyl-4-(2-nitrovinyl)-1-phenyl-1H-pyrazole (Table 3, entry 3d). Nitration was done by the general procedure with (E)-3-(3-methyl-1-phenyl-1H-pyrazol-4-yl)acrylic acid (0.25 mmol, 57 mg) as the substrate. Pure nitrated product was isolated by column chromatography through a silica gel column (mesh 60–120). Eluent: ethyl acetate/ petroleum ether (1:99 v/v); deep yellow solid; isolated yield: 74% (42 mg). \(^1\)H NMR (400 MHz, Chloroform-d) δ 2.49 (s, 3H), 7.33 – 7.38 (m, 1H), 7.45 – 7.53 (m, 3H), 7.65 – 7.69 (m, 2H), 8.00 – 8.06 (d, J = 13.7, Hz, 1H), 8.15 – 8.17 (s, 1H). \(^1^3\)C NMR (101 MHz, CDCl\(_3\)) δ 13.53, 113.63, 119.50, 127.75, 129.01, 129.88, 130.22, 135.12, 139.16, 151.47. GC-MS (m/z): 229.09 [M]+. M. Pt. 143-144°C (CHCl\(_3\)); Lit: 144°C. 

**Gram scale reaction with 4-methoxycinnamic acids:**
An oven-dried round bottom flask was fitted with a reflux condenser and charged with a magnetic stir-bar, TEMPO (4.8 mmol, 750 mg) and 4-methoxycinnamic acid (6 mmol, 1.086g) under air atmosphere. The solvent (MeCN, 25 mL) and \(^7\)BuONO (12 mmol, 1.424 mL) were added by laboratory syringe and micro liter syringe respectively. The round bottom flask was placed in a preheated oil bath at 50 ºC and the reaction mixture was stirred vigorously for 12 h. Then the reaction mixture was cooled to room temperature. Then the reaction mixture was filtered through a celite bed filter. Celite bed was washed with ethyl acetate as the washing solvent. Finally organic extract was concentrated and was purified by column chromatography using silica gel column (60-120 mesh size) with ethyl acetate/petroleum-ether (1:99 v/v) as the eluent. Crystalline yellow solid; isolated yield: 85% (0.9179g).

**Determination of E/Z ratio w.r.t time with 4-methoxycinnamic acids without TEMPO**

An oven-dried screw cap test tube was charged with a magnetic stir-bar and 4-methoxycinnamic acid (0.25 mmol, 45 mg) under air atmosphere in absence of TEMPO. \(^7\)BuONO (0.5 mmol, 60 µL) and the solvent (MeCN, 1 mL) were added by microliter syringe and laboratory syringe respectively. The reaction tube was placed in a preheated oil bath at 50 ºC and the reaction mixture was stirred vigorously for 1-4 h. Then the reaction mixture was cooled to room temperature. Reaction mixture was passed through flash column and dried. \(^1\)H NMR of the crude reaction mixture was taken and resulted in the formation of E and Z products are given in the bellow.

$^1$H NMR of crude reaction mixture of with 4-methoxycinnamic acids without TEMPO (after 12 h)

$^1$H NMR of crude reaction mixture of with 4-methoxycinnamic acids with TEMPO (after 12 h)

Identification of TEMPO by-products by GC-MS:
TEMPO by-products were checked by GC-MS after running our standard reaction mixture and the resulted by-products were found, GC-MS (m/z): 141.1, 156.2 170.2 [M]+.
Computational Studies

Two model systems were constructed to investigate the relative stabilities of the two reactive intermediates, 2 and 3 using density functional theory (DFT) calculations. In the two model systems, TEMPO was replaced by O-N(CH₃)₂ for computational considerations. Such a simplification of the original system is not expected to alter the qualitative trends of the computed relative energies. Geometry optimizations were performed on doublet spin state of the two model systems using the hybrid DFT B3LYP functional using the 6-31G* basis set. Intermediate 2 was found to be more stable than 3 by 5.0 kcal/mol. Such a difference of 5.0 kcal/mol is large enough to differentiate the two intermediates, and to drive all of the reaction via 2 leading to the formation of the E-isomer, and precluding the formation of the Z-isomer.

Intermediate 2 (with Me₂NO, instead of TEMPO)

Intermediate 3 (with Me₂NO, instead of TEMPO)
