General Methods

Reactions were carried out under dry N₂ using dry glassware. Tetrahydrofuran (THF) was distilled from sodium/benzophenone. Dichromomethane, diethyl ether, methanol and toluene were dried using a Pure Solv-MD Solvent Purification System. All other reagents and solvents were used as received from commercial suppliers unless otherwise indicated.

Liquid volumes less than 1 mL were measured and dispensed with Hamilton gastight syringes. Reaction temperatures refer to the temperature measured in an external bath. Progress of reactions was monitored by thin layer chromatography (TLC) using Merck Silica Gel 60 F₂₅₄ aluminium or plastic backed plates that were visualized with UV light, p-anisaldehyde or potassium permanganate. Flash column chromatography was carried out using Davisil 60 Å Silica Gel in the solvent systems indicated. Melting points were recorded using a Gallenkamp melting point apparatus and are uncorrected.

HPLC was carried out on a DIONEX summit P580 quaternary low pressure gradient pump with a built-in vacuum degasser using a Summit UVD 170s UV/Vis multi-channel detector. Solvents were used as HPLC grade. Chromeleon software was used to visualise and process the obtained chromatograms. Analytical separations used a flow rate of 1 mL/min, and semi-preparative used a flow rate of 3 mL/min and preparative used a flow rate of 20 mL/min.

NMR data were recorded either on a Bruker AV300, AVIII300, AV400, AVIII400 or DRX500 spectrometers in the deuterated solvents indicated and the spectra were calibrated on residual solvent peaks. Chemical shifts (δ) are quoted in ppm and J
values are quoted in Hz. In reporting spectral data, the following abbreviations were used: s (singlet), d (doublet), t (triplet), q (quartet), dd (doublet of doublets), m (multiplet), br (broad). In the case of ambiguous assignments, 2-dimensional homonuclear (\(^1\)H - \(^1\)H) and heteronuclear (\(^1\)H - \(^{13}\)C) NMR experiments were used. All NMR spectra were processed using MestReNova. NH and OH protons were not reported when these were not observed.

Infrared spectra were recorded on a Perkin Elmer Spectrum 100 FTIR spectrometer as neat films, wavelengths (\(\nu\)) are quoted in cm\(^{-1}\). Mass spectra were acquired on a Waters Micromass LCT TOF spectrometer using electrospray ionisation (ESI). Electron impact (EI) spectra were recorded on a Waters Micromass Zabspec/Magnetic sector mass spectrometer. Matrix-Assisted Laser Desorption Ionization (MALDI) spectra were either recorded on a Bruker Bi-flex MALDI Time of Flight mass spectrometer or a Waters Micromass MALDI mirco MX mass spectrometer.

Ethyl fumaroyl chloride (400 mg, 2.5 mmol, 1.0 eq.) was dissolved in dry DCM (25 mL) at RT. A solution of dibenzylamine (0.47 mL, 2.5 mmol, 1.0 eq.) and NEt\textsubscript{3} (0.35 mL, 2.5 mmol, 1.0 eq.) in dry DCM (25 mL) was added using a syringe pump over a period of 2 h. The reaction was stirred overnight and the solvent was removed \textit{in vacuo}. The crude product was purified by column chromatography with CHCl\textsubscript{3} / MeOH (98 / 2) as eluent to afford \((E)-\text{ethyl 4-(dibenzylamino)-4-oxobut-2-enoate (4)}\) as a yellow solid (779 mg, 98%). m.p. 98 °C; \textsuperscript{1}H NMR (300 MHz, CDCl\textsubscript{3}) \(\delta 7.33 \) (d, \( J = 15.2 \) Hz, 1H, CH), 7.23 – 6.96 (m, 10H, Ar, CH), 6.82 (d, \( J = 15.2 \) Hz, 1H, CH), 4.49 (s, 2H, CH\textsubscript{2}), 4.36 (s, 2H, CH\textsubscript{2}), 4.04 (q, \( J = 7.1 \) Hz, 2H, OCH\textsubscript{2}), 1.11 (t, \( J = 7.1 \) Hz, 3H, CH\textsubscript{3}); \textsuperscript{13}C NMR (100 MHz, CDCl\textsubscript{3}) \(\delta 165.5 \) (COO), 165.3 (CONH), 136.7 (Ar, C), 136.0 (Ar, C), 133.8 (CH), 132.2 (CH), 129.0 (Ar, CH), 128.7 (Ar, CH), 128.4 (Ar, CH), 128.3 (Ar, CH), 128.0 (Ar, CH), 127.7 (Ar, CH), 127.6 (Ar, CH), 126.7 (Ar, CH), 61.1 (CH\textsubscript{2}), 50.2 (CH\textsubscript{2}), 48.5 (CH\textsubscript{2}), 14.2 (CH\textsubscript{3}); HRMS (ES+) calculated for C\textsubscript{20}H\textsubscript{21}NO\textsubscript{3}Na[M+Na]\textsuperscript{+} 346.1419, found 346.1429.
(E)-4-(dibenzylamino)-4-oxobut-2-enoic acid (5)

(E)-ethyl 4-(dibenzylamino)-4-oxobut-2-enoate (4) (468 mg, 1.45 mmol, 1.0 eq.) was dissolved in EtOH (50 mL). A solution of NaOH (70 mg, 1.74 mmol, 1.2 eq.) in water (2.5 mL) was added dropwise. The reaction mixture was stirred for 8 h at RT. The reaction mixture was then acidified with 1 M HCl (10 mL), extracted with DCM (3 x 20 mL) and washed with brine (20 mL). The organic layers were combined, dried over MgSO₄ and concentrated under reduced pressure to afford (E)-4-(dibenzylamino)-4-oxobut-2-enoic acid (5) (427 mg, 99%) as a white solid. m.p. 174 °C; ¹H NMR (300 MHz, d₆-DMSO) δ 7.36 – 7.14 (m, 10H, Ar, CH), 6.94 (d, J = 15.1 Hz, 1H, CH₂), 6.69 (d, J = 15.1 Hz, 1H, CH), 4.58 (s, 2H, CH₂), 4.52 (s, 2H, CH₂); ¹³C NMR (100 MHz, d₆-DMSO) δ 169.7 (COO), 167.3 (CON), 143.2 (CH), 137.5 (Ar, C), 129.1 (Ar, CH), 128.7 (Ar, CH), 128.1 (Ar, CH), 127.8 (Ar, CH), 127.7 (Ar, CH), 127.6 (Ar, CH), 126.9 (Ar, CH), 126.0 (Ar, CH), 50.4 (CH₂), 48.8 (CH₂); HRMS (ES+) calculated for C₁₈H₁₇NO₃Na₂ [M+2Na]⁺ 340.0926, found 340.0932.

Suitable crystals of 9 were selected and datasets were measured on a Rigaku AFC12 goniometer equipped with an enhanced sensitivity (HG) Saturn724+ detector mounted at the window of an FR-E+ SuperBright molybdenum rotating anode generator ($\lambda_{\text{Mo-K} \alpha} = 0.71075$ Å) with HF Varimax optics and for 10 on a Bruker SMART 6000 diffractometer ($\lambda_{\text{Cu-K} \alpha} = 1.54184$ Å). The data collections were driven and processed by CrystalClear-SM Expert 2.0 r7 for 9 and were driven by SMART\textsuperscript{2} and processed by SAINTPLUS\textsuperscript{3} for 10. Absorption corrections were applied using CrystalClear-SM Expert 2.0 r7 for 9 and using SADABS\textsuperscript{4} for 10. The structure of 9 was solved using ShelXS-97\textsuperscript{5} and of 10 by SIR2004\textsuperscript{6} and both structures were refined by a full-matrix least-squares procedure on $F^2$ in ShelXL-97.\textsuperscript{5}

In 9 two phenyl rings and a solvent ethanol molecule are disordered while in 10 an ethanol molecule and methanol molecule are present on the same site at 50 % occupancy each and one water molecule is disordered over three positions while another is not disordered. All non-hydrogen atoms were refined with anisotropic displacement parameters apart from the disordered ethanol molecule in 9 and one part of the disordered water molecule in 10. All hydrogen atoms in 9 and those not belonging to water molecules in 10 were added at calculated positions and refined by use of a riding model with isotropic displacement parameters based on the equivalent isotropic displacement parameter ($U_{eq}$) of the parent atom. In 10 the hydrogen atoms belonging to one water molecule were refined subject to bond distance and angle restraints while it was not possible to refine hydrogen atom positions belonging to the disordered water molecule and methanol molecule. As a result not all the hydrogen bonding could be tabulated for 10.
