General methods

Chemicals were purchased from Sigma-Aldrich or Fluka and were used as received. The compounds, 1,1′′-[1,4-phenylenebis(methylene)]bis(4,4′-bipyridinium) bis(hexafluorophosphate) (3•2PF₆), 1,4-bis(2-(2-methoxyethoxy)ethoxy)ethoxy)benzene (7), cyclobis(paraquat-p-phenylene) tetrakis(hexafluorophosphate) (CBPQT•4PF₆), 1,4-bis-[2-(2-hydroxyethoxy)ethoxy]benzene monotosylate (S1), 2-[4-(2-cyanoethylthio)-5-ethylthio-1,3-dithiole-2-ylidene]-5-tosyl-(1,3)-dithiolo[4,5-c]pyrrole (S7), 3,5-di-t-butyl-bromomethylbenzene (S9), 1-iodo-2-(2-methoxyethoxy)ethane, 1-iodo-2-[2-(2-methoxyethoxy)ethoxy]ethane, and 3-((5-(methylthio)-2-(5-tosyl-5H-[1,3]dithiolo[4,5-c]pyrrol-2-ylidene)-1,3-dithiol-4-yl)thio)propanenitrile were all prepared according to literature procedures. All reactions were carried out under an anhydrous nitrogen atmosphere unless otherwise stated. THF was distilled from Na/benzophenone immediately prior to use, while MeOH was distilled from Mg immediately before use. CH₂Cl₂ was distilled before use. DMF was allowed to stand over molecular sieves (4 Å) for at least 3 days prior to use, while Me₂CO was dried over Drierite for at least 3 days before use. Petroleum ether used had boiling point 60–80 °C. NaI was dried in an oven at 160 °C for 24 h before use. High pressure reactions were performed in a specially made teflon-tube, using a Shicka high pressure apparatus. Thin-layer chromatography (TLC) was carried out using aluminum sheets precoated with silica gel 60F (Merck 5554). The plates were inspected under UV light (254 nm) and, if required, developed in I₂ vapor. Column chromatography was carried out using silica gel 60F (Merck 9385, 0.040–0.063 mm). Melting points (M.p.) were determined on a Büchi melting point apparatus and are uncorrected. ¹H NMR and ¹³C NMR spectra were recorded at room temperature at 400 MHz and 100 MHz, respectively, on a Bruker ADVANCED III spectrometer using residual non-deuterated solvent as the internal standard. The solvent signals were assigned by Nudelman et al. All chemical shifts are quoted on a δ scale, and all coupling constants (J) are expressed in Hertz (Hz). The following abbreviations are used in listing the NMR spectra: s = singlet, bs = broad singlet, d = doublet, t = triplet, q = quartet, and m = multiplet. Samples were prepared using CDCl₃, CD₃CN, or CD₃SOCD₃ purchased from Cambridge Isotope Labs or Sigma-Aldrich. Matrix assisted laser-desorption/ionization time-of-flight mass spectrometry (MALDI-TOF-MS) was performed on a Bruker Autoflex III Smartbeam mass spectrometer, utilizing a 2,5-dihydroxybenzoic acid matrix, while electrospray ionization mass spectrometry (ESI-MS) was performed on a Thermo Finnigan MAT SSQ710 single stage quadropole mass spectrometer. UV-Vis-NIR spectroscopic data were recorded on a Shimadzu UV-1601PC spectrophotometer. Elemental analyses were performed by the Atlantic Microlabs, Inc., Atlanta, Georgia.
Synthesis of the [2]rotaxane 1•4PF₆

A mixture of the monotosylate S¹ (8.05 g, 2.15 mmol) and anhydrous NaI (9.12 g, 60.8 mmol) in anhydrous Me₂CO (300 mL) was heated under reflux for 27 h, whereafter the reaction mixture was cooled to room temperature. The precipitate was filtered off, washed with Me₂CO (2 × 50 mL), and the combined organic phases were concentrated. The resulting residue was dissolved in CH₂Cl₂ (300 mL), washed with a saturated aqueous solution of Na₂S₂O₃ (100 mL), H₂O (3 × 100 mL), and dried (MgSO₄). Removal of the solvent gave a yellow oil, which was purified using column chromatography (SiO₂, Me₂CO:petroleum ether 3:1 v/v) affording the title compound S² as a bright yellow semi-crystalline compound (6.50 g, 88%).

Separation of the isomeric \( ^{2} \) rotaxanes 1·4PF₆·HQ and 1·4PF₆·MPTTF.

The two isomers of 1·4PF₆ were separated using preparative thin layer chromatography (PTLC), which was performed at room temperature using Me₂CO/NH₄PF₆ (1.0 g NH₄PF₆ in 100 mL Me₂CO) as the eluent. After eluation, the green band containing 1·4PF₆·MPTTF was extracted into Me₂CO. Dumbbell 8. A solution of the MPTTF compound S14 (434 mg, 1.02 mmol) and 3,5-di-tert-butyl-bromomethylbenzene (S9) (319 mg, 1.13 mmol) in anhydrous DMF (75 mL) was degassed (N₂, 15 min) before NaH (55–65% v/v in mineral oil, 335 mg, 8.38 mmol) was added in one portion. Subsequently, the reaction mixture was stirred at room temperature for 1 h, before the reaction was terminated by carefully and slowly addition of H₂O (250 mL). Characterization of the [2]rotaxane 1•4PF₆

**Absorption spectroscopy.** The UV/Vis/NIR absorption spectra (MeCN, 298 K) recorded of different mixtures of the two isomers of the [2]rotaxane 1•4PF₆ (c = 0.6 mM) are shown in Fig. S1. The charge transfer (CT) absorption band observed at 490 nm is associated with isomer where CBPQT•4PF₆ encircles the HQ station, while the CT absorption band observed at 820 nm is associated with the isomer where CBPQT•4PF₆ encircles the MPTTF station.

**Fig. S1** UV/Vis/NIR absorption spectra (MeCN, 298 K) recorded of different mixtures of the two isomers of the [2]rotaxane 1•4PF₆ (c = 0.6 mM) obtained from the clipping reaction carried out at (a) 1 bar, (b) 5 kbar, (c) 10 kbar, and (d) 15 kbar.

**1H NMR spectroscopy.** The ¹H NMR spectrum (400 MHz, CD₃CN, 298 K) recorded of the [2]rotaxane 1•4PF₆ synthesized at 5 kbar is shown in Fig. S3. The descriptions used to assign the signals in the ¹H NMR spectra are in Fig. S2. The partial ¹H NMR spectra (400 MHz, CD₃CN, 298 K) shown in Fig. S4 illustrate how the isomeric distribution of the two different isomers of the [2]rotaxane 1•4PF₆ change when the pressure is varied from 1 bar to 15 kbar. In Fig. S2–S4, a red color indicates that CBPQT•4PF₆ encircle the HQ station, while a green color indicates that CBPQT•4PF₆ encircles the MPTTF station.

Fig. S3 Partial $^1$H NMR spectra (400 MHz, CD$_3$CN, 298 K) recorded of an isomeric mixture of the [2]rotaxane $\text{1} \cdot \text{4PF}_6$ ($c = 2.76$ mM). Assignment of the signals is based on the descriptions shown in Fig. S2. The assignments in red are associated with the isomer where CBPQT•4PF$_6$ encircles the HQ station, while the assignments in green are associated with the isomer where CBPQT•4PF$_6$ encircles the MPTTF station.
Fig. S4 Partial $^1$H NMR spectra (400 MHz, CD$_3$CN, 298 K) recorded of different mixtures of the two isomers of the [2]rotaxane 1•4PF$_6$ obtained from the clipping reaction carried out at (a) 1 bar, (b) 5 kbar, (c) 10 kbar, and (d) 15 kbar. The singlet at $\delta$ 4.97 ppm corresponds to the NCH$_2$ resonance when CBPQT•4PF$_6$ encircles the HQ station and the singlet at $\delta$ 5.18 ppm corresponds to the NCH$_2$ resonance when CBPQT•4PF$_6$ encircles the MPTTF station. From the integrals of the two different NCH$_2$ resonances, the ratio of the two isomeric rotaxanes was obtained. The change in ratio between the two different isomers is also evident from the signals associated with the CH$_2$CH$_3$ ($\delta$ 1.20 and 1.50 ppm), the C(CH$_3$)$_3$ ($\delta$ 1.28 + 1.48 ppm), and the CH(CH$_3$)$_2$ ($\delta$ 1.12 + 1.18 ppm) protons, where the assignments in red are associated with the isomer where CBPQT•4PF$_6$ encircles the HQ station, while the assignments in green are associated with the isomer where CBPQT•4PF$_6$ encircles the MPTTF station.

The charge transfer (CT) absorption band observed at 460 nm is associated with 5•4PF₆ where CBPQT•4PF₆ encircles the HQ station, while the CT absorption band observed at 820 nm is associated with 6•4PF₆ where CBPQT•4PF₆ encircles the MPTTF station.

**Determination of binding constants using the UV/Vis dilution method**

7©CBPQT•4PF₆. Mixing the colorless cyclophane CBPQT•4PF₆ and the HQ thread 7 in equimolar proportions in MeCN immediately produced a light red-colored solution, as a result of the appearance (Fig. S10a) of a CT absorption band centered around $\lambda_{\text{max}} = 464$ nm. Appropriate dilutions of two independent stock solutions produced solutions with absolute concentrations ($c$) in the range of $10^{-3}$ M, which was placed in the thermostatted cell compartment of the UV/Vis spectrophotometer and allowed to equilibrate at 298 K before the absorbance $A$ was measured at 464 nm ($\lambda_{\text{max}}$). Subsequently, the solution was repeatedly diluted with MeCN to give absorptions between 1 and 0.1. After each dilution, the solution was allowed to equilibrate at 298 K before the absorbance $A$ was measured at 464 nm ($\lambda_{\text{max}}$), which resulted (Table S1) in 32 data points $[1/A^{1/2}, c/A]$ for 7©CBPQT•4PF₆.

Plotting \( c/A \) against \( 1/A^{1/2} \) afforded a straight line with slope \( \alpha \) of \((1/K_a \varepsilon l)^{1/2}\) and a \( y \) intercept \( y_0 \) of \( 1/\varepsilon l \), where \( \varepsilon \) is the molar extinction coefficient for the CT band of the complex and \( l \) is the optical path length. The linear relationship (Fig. S10b) between \( c/A \) and \( 1/A^{1/2} \) was demonstrated by calculation of the correlation coefficient and a value of 0.989 was obtained. The \( K_a \) and \( \varepsilon \) values were obtained from the relationship\(^{S11}\) \( K_a = y_0/\alpha^2 \), where \( \alpha \) and \( y_0 = 1/\varepsilon l \) is the slope and \( y \)-intercept of the line, respectively. The free energies of complexation (\( -\Delta G^0 \)) were calculated using the relationship \( \Delta G^0 = -RT\ln K_a \), where \( R \) is the gas constant and \( T \) is the absolute temperature.

8\text{cCBPQT\textbullet4PF}_6. The binding constant between the MPTTF thread 8 and CBPQT\textbullet4PF\textsubscript{6} was determined using an similar approach as for 7\text{cCBPQT\textbullet4PF\textsubscript{6}}. Solutions with absolute concentrations (c) in the range of 10^{-3} \text{ M} was subsequently repeatedly diluted with MeCN to give absorptions between 1 and 0.1. In these experiments, the CT absorption band was centered (Fig. S11a) around \lambda_{\text{max}} = 783 \text{ nm} and a total of 30 data point were obtained (see Fig. S11b).

S8 The yields of 1•4PF₆•HQ and 1•4PF₆•MPTTF were determined from integration of the resonances associated with the methylene protons (i.e., HNCH₂, see Fig. S4) located between the pyrrole ring and the 3,5-di-t-butylbenzene stopper.

S9 The compound was isolated as a byproduct in the synthesis of S1.

S10 The yields of 5•4PF₆ and 6•4PF₆ were determined from integration of the resonances associated with the methylene protons on the 2,6-di-i-propylphenylene stopper of 5•4PF₆ and the methylene protons on the 3,5-di-t-butylbenzene stopper of 6•4PF₆.
