Supplementary information

Methods

Synthesis and characterization of 5-oxo-2,3-dihydro-5H-[1,3]thiazolo[3,2-a]pyridine-3,7-dicarboxylic acid (TPA)

Citric acid 1.21 g (6.3 mmol) (Sigma-Aldrich, Germany) was mixed with L-cysteine 0.79 g (6.3 mmol) (Sigma-Aldrich, Germany) and water (1 ml) until complete dissolution then the solvent was evaporated under vacuum (10 mbar) at r.t. Afterwards mixture was heated at 100°C for 40 minutes and purified by preparative high pressure liquid chromatography (Knauer HPLC set: degasser, pump K-500, detectors RI 2300 and UV/VIS A2500) at r.t. on Eurospher 100 C-18 column and eluted by 1.35×10^{-3} M trifluoroacetic acid in water at a flow rate 10 ml/min. The luminescent fraction of desired product was collected and freeze-dried. The chemical structure was confirmed by C^{13}, H^{1}, HSQC and COSY NMR experiments carried out in DMSO-d6 solution using a Varian Mercury-VX 300 MHz spectrometer. LC-ESI-MS measurements were performed on a Waters ACQUITY triple-quadrupole tandem mass spectrometric detector with an electrospray ionization (ESI) interface. The separation was accomplished at 40°C, on Acquity UPLC BEH C18 1.7 μm, 2.1 x 100 mm column using 0.1 % water solution of formic acid as the eluent at flow 0.3 ml/min. UV/VIS absorption spectra and emission spectra (excitation at 365 nm) of water solutions of TPA were acquired on a PG Instruments Ltd P80+ spectrophotometer and an Ocean Optics MINI-D2 spectrofluorimeter, respectively.

Synthesis and hydrolysis of cys-BPLP, POC, POCTPA0.0001-1 films

Citric acid, 1,8-octanediol and L-cysteine were combined at molar ratio 1:1:0.5. After melting the mixture at 160°C for 20 minutes, the temperature was brought down to 140 °C stirring continuously for another 45 minutes to obtain the cys-BPLP prepolymer (pre-cys-BPLP). For comparison reaction without amino acid was also conducted as well as with different amounts of TPA (1, 0.1, 0.01, 0.001 and 0.0001 % w/w) added instead of L-cysteine to form pre-POC and pre-POCTPA0.0001-1, respectively. Afterwards 30% w/w 1,4-dioxane solutions of prepolymer (pre-cys-BPLP, POC and POCTPA-0.0001-1) were cast on Teflon molds, heated to 80°C and kept at this temperature for 5 days to produce cross-linked films of cys-BPLP, POC, POCTPA0.0001-1. For hydrolysis 1g of each sample was placed in 6ml of 2 M Na_2CO_3 and kept at 90°C for 24 hours. Next the hydrolyzate was neutralized with 1M HCl and luminescent fraction was collected using preparative HPLC and freeze-dried as described above.

Synthesis of esters of TPA and 1,8-octanediol
TPA 50 mg (0.2 mmol) and 1,8-octanediol 90 mg (0.6 mmol) were combined and heated at 140°C for 1 hour. Products of this reaction were characterized by LC-ESI-MS (Figure S10a and S10b).
