General detailed information

All reactions were run under an atmosphere of argon, unless otherwise indicated. Reaction tubes were oven-dried and cooled under a stream of argon. Reactions tubes were purchased from Fischer Scientific (catalog number 14-959-35C). Ru3(CO)12 and phosphine ligands were used as received from commercial suppliers. THF was dried over sodium/benzophenone, distilled immediately prior to use, and transferred via an oven-dried syringe. Isoprene was distilled in a Hickman still immediately prior to use. Analytical Thin-layer chromatography (TLC) was carried out using 0.25 mm commercial silica gel plates. Visualization was accomplished with UV light followed by dipping in KMnO4 and/or p-anisaldehyde solution and heating. Column chromatography was carried out with Silicycle silica gel (40-60 µm). Infrared spectra were recorded on a Perkin-Elmer 1600 spectrometer. Mass spectra were obtained on a Karatos MS9 and a TSQ Quantum GC and are reported as m/z (relative intensity). Accurate masses are reported for the molecular ion [M+H]+ or a suitable fragment ion. Melting points were obtained on a Thomas-Hoover Unimelt apparatus and are uncorrected. Proton and deuteron nuclear magnetic resonance (1H NMR) spectra were recorded with a Varian Gemini 400 MHz spectrometer. Chemical shifts are reported in delta (δ) units, parts per million (ppm) downfield from tetramethylsilane or ppm relative to the center of the singlet at 7.26 ppm for deuteriochloroform and 2.50 ppm for DMSO-d6. Coupling constants J values are reported in Hertz (Hz). Carbon-13 nuclear magnetic resonance (13C NMR) spectra were recorded with a Varian Gemini 400 spectrometer (100 MHz). Chemical shifts are reported in delta (δ) units, ppm relative to the center of the triplet at 77.0 ppm for deuteriochloroform. 13C NMR spectra were routinely run with broadband decoupling.
Experimental Procedures and Spectroscopic Data for the hydantoins (1a - 1f)

**Experimental Procedure**\(^1,2,3,4\)

**Preparation of hydantoins (1a, 1d, 1e, or 1f)**

To a one neck round bottom flask equipped with a reflux condenser was added a aldehyde (100 mol%), KCN (120 mol%), (NH\(_4\))\(_2\)CO\(_3\) (500 mol%) in a solution of 50% EtOH. The reaction mixture was allowed to stir vigorously at 60 - 70 °C for 12 - 18 h, at which point the reflux condenser was removed and the reaction was concentrated by evaporating the water for 1-2 hours. Then the reaction mixture was cooled to 0 °C, at which point concentrated HCl was added until pH 6-7, and a solid precipitated which was collected upon filtration and washed with ice-water. The crude hydantoin (100 mol%) was dissolved in DMF in a round bottom flask. To the stirring solution was added K\(_2\)CO\(_3\) (400 mol%) at 0 °C. The solution was allowed to stir at 0 °C for 10-15 min, at which point BnCl (100 mol%) was added dropwise. The reaction mixture was allowed to stir at ambient temperature for 18 h. The reaction mixture was diluted with EtOAc and then transferred to a separatory funnel. The organic layer was washed with water (4 times). The organic layer was then dried over Na\(_2\)SO\(_4\) and concentrated under reduced pressure. The crude product was purified by silica gel flash column chromatography to provide n-benzyl protected hydantoins (1a, 1d, 1e, or 1f).

**Preparation of hydantoins (1b or 1c)**

To a three neck round bottom flask equipped with a reflux condenser was added a aldehyde (100 mol%), KCN (200 mol%), (NH\(_4\))\(_2\)CO\(_3\) (400 mol%) in a solution of 50% EtOH. The reaction mixture was allowed to stir vigorously at 70 °C for 24 h, at which point the reflux condenser was removed and the reaction was concentrated by evaporating the water for 1-2 hours. Then the reaction mixture was cooled to 0 °C, at which point concentrated HCl was added until pH 6-7, and a solid precipitated which was collected upon filtration. The crude hydantoin (100 mol%) was dissolved in DMF in a round bottom flask. To the stirring solution was added K\(_2\)CO\(_3\) (400 mol%) at 0 °C. The solution was allowed to stir at 0 °C for 10-15 min, at which point BnCl (100 mol%) was added dropwise. The reaction mixture was allowed to stir at ambient temperature for 24 h. The reaction mixture was diluted with CH\(_2\)Cl\(_2\) and then transferred to a separatory funnel. The organic layer was washed with 1M HCl solution. The organic layer was then dried over

---

MgSO₄ and concentrated under reduced pressure. The crude product was then recrystallized in EtOAc / CH₂Cl₂ / hexanes to provide hydantoins (1b or 1c).

**N- Benzyl protected phenyl hydantoin (1a)**

![](image)

**General Procedure**: To KCN (15.6 g, 0.24 mol, 120 mol%) and (NH₄)₂CO₃ (19.6 g, 1.00 mol, 500 mol%) in a solution of 50% EtOH (600 mL) was added benzaldehyde (20.4 mL, 0.2 mol, 100 mol%) and the resulting solution was heated to 65 °C for 18 h. The crude product was obtained as a white solid (24 g, 68%). After the protection of the hydantoin, the crude product was purified by silica gel flash column chromatography (elution with EtOAc : Toluene = 1 : 2 to 2 : 1) to produce the hydantoin 1a (14.5 g, 40%) as a white solid.

**¹H NMR** (400 MHz, DMSO-d₆) : δ 8.82 (s, 1H), 7.42 - 7.30 (m, 7H), 7.28 - 7.23 (m, 3H), 5.32 (s, 1H), 4.59 (d, \( J = 15.6 \), 1H), 4.54 (d, \( J = 15.2 \), 1H). The **¹H NMR** data were consistent with the reported values.⁵,⁶

**N- Benzyl protected isopropyl phenyl hydantoin (1b)**

![](image)

**General Procedure**: To KCN (13.0 g, 0.20 mol, 200 mol%) and (NH₄)₂CO₃ (38.4 g, 0.40 mol, 400 mol%) in a solution of 50% EtOH (300 mL) was added 4-isopropylbenzaldehyde (14.8 g, 0.10 mol, 100 mol%) and the resulting solution was heated to 70 °C for 24 h. The crude hydantoin was obtained as a white solid (21 g, 95%). After the protection of the hydantoin, the crude product was purified by recrystallized in EtOAc / CH₂Cl₂ / hexane to provide the hydantoin 1b (16 g, 55%) as a white solid.

**N- Benzyl protected 4-fluorophenyl hydantoin (1c)**

![Chemical Structure](image)

**General Procedure**: To KCN (13.0 g, 0.20 mol, 200 mol%) and (NH₄)₂CO₃ (38.4 g, 0.40 mol, 400 mol%) in a solution of 50% EtOH (300 mL) was added 4-fluorobenzaldehyde (12.4 g, 0.10 mol, 100 mol%) and the resulting solution was heated to 70 °C for 24 h. The crude hydantoin was obtained as a white solid (17 g, 87 %). After the protection of the hydantoin, the crude product was purified by recrystallization in EtOAc/ CH₂Cl₂ / hexanes to provide the hydantoin 1c (8 g, 34 %) as a white solid.

**¹H NMR** (400 MHz, CDCl₃) : δ 7.37 - 7.28 (m, 7H), 7.10 - 7.05 (m, 2H), 6.32 (s, 1H), 5.04 (s, 1H), 4.70 (d, J = 14.8 Hz, 1H), 4.63 (d, J = 14.8 Hz, 1H).

**¹³C NMR** (100 MHz, CDCl₃) : δ 171.6, 164.3, 161.8, 157.2, 135.7, 129.9, 128.7, 128.5, 128.3, 128.2, 128.0, 116.3, 116.0, 60.1, 42.5.

**FTIR** (neat) νₘₐₓ 2977, 2860, 1773, 1706, 1603, 1513, 1451, 1350, 1233, 1119 cm⁻¹.

**Melting Point**: 165 - 166 °C.
N- Benzyl protected 4-methoxyphenyl hydantoin (1d)

![Structure of 1d](image)

**General Procedure**: To KCN (3.1 g, 48 mmol, 120 mol%) and (NH₄)₂CO₃ (19.2 g, 200 mmol, 500 mol%) in a solution of 50% EtOH (120 mL) was added 4-methoxy-benzaldehyde (5.4 g, 40 mmol, 100 mol%) and the resulting solution was heated to 60 °C for 18 h. The crude hydantoin was obtained as a white solid (6.1 g, 74 %). After the protection of the hydantoin, the crude product was purified by silica gel flash column chromatography (elution with EtOAc : hexane = 1 : 2 to 1 : 1) produce the hydantoin (3.4 g, 56 %) as a white solid.

**¹H NMR** (400 MHz, CDCl₃) : δ 7.39 - 7.38 (m, 2H), 7.33 - 7.27 (m, 3H), 7.21 (dt, J = 6.8, 2.0 Hz, 2H), 6.90 (dt, J = 6.8, 2.0 Hz, 2H), 6.07 (s, 1H), 4.99 (s, 1H), 4.70 (d, J = 14.4 Hz, 1H), 4.63 (d, J = 14.4 Hz, 1H), 3.80 (s, 3H).

**¹³C NMR** (100 MHz, CDCl₃) : δ 172.1, 160.2, 157.2, 135.9, 128.7, 128.5, 127.9, 127.7, 126.1, 114.5, 60.3, 55.3, 42.4.

**FTIR** (neat) νmax 3294, 1770, 1702, 1611, 1514, 1457, 1440, 1251, 1180 cm⁻¹.

**Melting point**: 157 - 158 °C.

N- Benzyl protected piperonyl hydantoin (1e)

![Structure of 1e](image)

**General Procedure**: To KCN (3.1 g, 48 mmol, 120 mol%) and (NH₄)₂CO₃ (19.2 g, 200 mmol, 500 mol%) in a solution of 50% EtOH (120 mL) was added piperonal (6.0 g, 40 mmol, 100 mol%) and the resulting solution was heated to 60 °C for 18 h. The crude hydantoin was obtained as a white solid (6.1 g, 74 %). After the protection of the hydantoin, the crude product was purified by silica gel flash column chromatography (elution with EtOAc : hexane = 1 : 2 to 1 : 1) produce the hydantoin (3.4 g, 56 %) as a white solid.

---

obtained as a white solid (6.6 g, 75 %). After the protection of the hydantoin, the crude product was purified by silica gel flash column chromatography (elution with CH$_2$Cl$_2$ to EtOAc : hexane = 1 : 2) produce the hydantoin 1e (3.3 g, 36 %) as a white solid.

$^1$H NMR (400 MHz, CDCl$_3$) : $\delta$ 7.35 - 7.23 (m, 5H), 6.76 (s, 2H), 6.72 (s, 1H), 6.13 (s, 1H), 5.94 (s, 2H), 4.92 (s, 1H), 4.66 (d, $J$ = 14.4 Hz, 1H), 4.60 (d, $J$ = 14.4 Hz, 1H).

$^{13}$C NMR (100 MHz, CDCl$_3$) : $\delta$ 171.8, 157.2, 148.4, 135.8, 128.7, 128.4, 128.0, 127.7, 120.2, 108.6, 106.7, 101.4, 60.6, 42.4.

FTIR (neat) $\nu_{max}$ 3297, 1769, 1702, 1489, 1443, 1418, 1361, 1249, 1187, 1135 cm$^{-1}$.

LRMS[$ES+$] calcd for C$_{17}$H$_{14}$N$_2$O$_4$ [M+Na]$^+$ 333.1, found 333.1.

Melting Point : 141 - 143 °C.

N- Benzyl protected 3-pyridinyl hydantoin (1f)

General Procedure : To KCN (6.3 g, 96 mmol, 120 mol%) and (NH$_4$)$_2$CO$_3$ (30.7 g, 320 mmol, 500 mol%) in a solution of 50% MeOH (120 mL) was added 3-pyridinecarboxaldehyde (7.5 mL, 80 mmol, 100 mol%) and the resulting solution was heated to 60 °C for 12 h. The crude hydantoin$^{10}$ was obtained as a yellow solid (6.8 g, 48 %). After the protection of the hydantoin, the crude product was purified by silica gel flash column chromatography (elution with EtOAc : hexane = 3 : 1 to EtOAc : Toluene 1 : 5) produce the hydantoin 1f (5.6 g, 55 %) as a white solid.

$^1$H NMR (400 MHz, CDCl$_3$) : $\delta$ 8.61 - 8.59 (m, 2H), 7.65 (d, $J$ = 8.0 Hz, 1H), 7.37 - 7.27 (m, 6H), 6.92 (s, 1H), 5.08 (d, $J$ = 0.8 Hz, 1H), 4.70 (d, $J$ = 14.8 Hz, 1H), 4.63 (d, $J$ = 14.8 Hz, 1H).

$^{13}$C NMR (100 MHz, CDCl$_3$) : $\delta$ 171.1, 157.3, 150.2, 147.9, 135.5, 134.2, 130.2, 128.7, 128.5, 128.1, 123.9, 58.5, 42.6.

FTIR (neat) $\nu_{max}$ 3389, 1773, 1712, 1444, 1340, 1253, 1188 cm$^{-1}$.

LRMS[$ES+$] calcd for C$_{15}$H$_{13}$N$_3$O$_2$ [M+H]$^+$ 268.1, found 268.1. Melting Point : 147 - 149 °C.

---

**Experimental Procedures and Spectroscopic Data for the hydroaminoalkylation of isoprene with hydantoins (1a - 1f) to form the prenylated adducts (3a - 3f)**

**General Experimental Procedures for the hydroaminoalkylation of isoprene with hydantoins (1a - 1e)**

A pressure tube equipped with magnetic stir bar was added Ru$_3$(CO)$_{12}$ (3.8 mg, 0.006 mmol, 3 mol%), [PhP(CH$_2$CH$_2$PPh$_2$)$_2$] (12.8 mg, 0.024 mmol, 12 mol%), and hydantoins (0.200 mmol, 100 mol%) was sealed with a rubber septum, purged with argon. To the tube was added an isoprene solution (0.22 mL, 600 mol%, 1.2 M in THF) (the isoprene solution was prepared by mixing with isoprene (0.36 mL, 3.600 mmol) and THF (0.3 mL), and then it was dried over molecular sieves prior to use). The rubber septum was replaced with a screw cap. The resulting mixture was immersed to a pre-heated oil bath (140°C). After 48 h, the reaction mixture was slowly cooled to room temperature and concentrated under reduced pressure. To the residue was added 1,3,5-trimethoxybenzene (33.6 mg, 0.200 mmol, 100 mol%) as an internal standard to determine NMR yields. The mixture was concentrated under reduced pressure again and purified by short packed silica gel column chromatography (elution with EtOAc : Toluene = 1 : 20) to give prenylated products (3a - 3f) as white solids.

**General Experimental Procedures for the hydroaminoalkylation of isoprene with a hydantoin (1f)**

The general procedure is the same as other hydantoins (1a - 1e) above. The crude product was purified by short packed silica gel column chromatography (elution with EtOAc : hexane = 1 : 1 to CH$_2$Cl$_2$) to give a prenylated product (3f) as a white solid.

Experimental Procedures and Spectroscopic Data for hydroamination of prenylated adduct 3a

The triflic acid-catalyzed hydroamination procedures were used.\textsuperscript{11, 12} To prenylated adduct 3a (14.1 mg, 0.042 mmol, 100 mol%) solution in toluene (1.7 mL) was added TfOH (0.2 µL, 0.002 mmol, 5 mol%) under argon. The resulting mixture was heated to 70 °C and stirred for 10 h. After cooling to room temperature, the resulting solution was quenched with saturated aq. NaHCO\textsubscript{3} and extracted with CH\textsubscript{2}Cl\textsubscript{2} (1 mL x 2). The combined organic layer was dried over MgSO\textsubscript{4} and concentrated under reduced pressure. The residue was purified by silica gel column chromatography (elution with EtOAc : n-hexane = 1 : 4) to obtain 4a (10.9 mg, 77 %) as a colorless oil.

Experimental Procedures and Spectroscopic Data for reduction of prenylated adduct 3a

The reduction procedure of Kohn et al. was used.\textsuperscript{5} To a pressure tube equipped with magnetic stir bar was added prenylated adduct 3a (19.2 mg, 0.0574 mmol, 100 mol%). The tube was sealed with a rubber septum, purged argon. To the tube was added THF (1.9 mL) and then LAH (0.689 mmol, 26.1 mg, 1200 mol%) was quickly added to the tube. The rubber septum was replaced with a screw cap. The reaction mixture was stirred at 67 °C. After 60 h, the resulting mixture was cooled to room temperature and added 10% NaOH solution (2 mL). The mixture was diluted with EtOAc (10 mL) and filtered throughout Celite. The resulting mixture was separated and the aqueous layer was extracted with EtOAc. The combined organic layer was concentrated under reduced pressure and purified by silica gel column flash column chromatography (elution with CH\textsubscript{2}Cl\textsubscript{2} : MeOH = 7 : 1) to afford the vicinal diamine 5a (15.5 mg, 87 %) as a colorless oil.
