General Information

Flash chromatography was performed on silica gel 100-200 m. The solvent system used was a gradient of petroleum ether/ethyl acetate, increasing in polarity to ethyl acetate. Thin layer chromatography (TLC) was performed on glass backed plates pre-coated with silica (GF254), which were developed using standard visualizing agents. $^1$H and $^{13}$C NMR spectra were recorded on a 600 MHz BRUKER AVANCE spectrometer at 25 °C. $^1$H: Chemical shifts are reported in ppm with the solvent resonance as the internal standard (CHCl$_3$: δ 7.26 ppm). Data are reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, br = broad, m = multiplet, sept = septet), integration, coupling constants ($J$) in Hz. $^{13}$C NMR spectra were recorded with complete proton decoupling. Chemical shifts are reported in ppm with the solvent resonance as the internal standard (CDCl$_3$: δ 77.0 ppm). High-resolution mass spectra (HRMS) recorded for accurate mass analysis, were performed on either a Q-TOF micro (Waters) spectrometer. Melting points were performed on recrystallised solids and recorded on a national standard melting point apparatus and are uncorrected.

Reaction conditions: benzamide 1 (0.3 mmol), aldehyde 2 (0.9 mmol), Pd(cat) (10 mol%), TBHP (70% in H$_2$O) (5.0 equiv), additive (1.0 equiv) at 130 °C in DMSO:dioxane 4:1 (1.5 mL, 0.2 M), 5-12 h. *0.4 equiv of BF$_3$OEt$_2$ was used.
General Procedures

All the known amides were prepared following literature procedure\textsuperscript{1-4} and the analytical data are agreed with those data which have been reported previously.

**General Procedure A: Synthesis of $N$-alkoxybenzamides**

\[
\begin{align*}
\text{R} & \quad \text{OH} \\
& \quad 1) \text{oxalyl chloride, DMF, CH}_2\text{Cl}_2 \\
& \quad 2) \text{RONH}_2\text{HCl, K}_2\text{CO}_3, \text{EtOAc:H}_2\text{O},
\end{align*}
\]

Following same procedure by Guimond et al\textsuperscript{1}

To a solution of the carboxylic acid (10 mmol) in CH\textsubscript{2}Cl\textsubscript{2} (0.3 M) at 0 °C under N\textsubscript{2} was added dropwise oxalyl chloride (12 mmol) followed by a catalytic amount of DMF (2 drops). The reaction was allowed to stir at room temperature until completion (typically 4h). The solvent was then removed under reduce pressure to afford the corresponding crude acid chloride. Alkoxamine hydrochloride (11 mmol) was added to a biphasic mixture of K\textsubscript{2}CO\textsubscript{3} (20 mmol) in a 2:1 mixture of EtOAc:H\textsubscript{2}O (0.2 M). The resulting solution was cooled to 0°C followed by addition of a solution unpurified acid chloride in a minimum amount of EtOAc dropwise. The flask containing the acid chloride was then rinsed with additional EtOAc. The reaction was stirring for 4h and slowly warmed up to room temperature. The two layers were separated and extracted with EtOAc (40 mL x 2). The combined organic phase was dried over anhydrous Na\textsubscript{2}SO\textsubscript{4}, filtered, and evaporated under reduced pressure. The residue was purified by flash column chromatography on silica gel.

**General Procedure B: Synthesis of $N$-isopropoxybenzamides**

The amide was prepared by following the procedure reported by A. Nickon et al\textsuperscript{5}, and the analytical data are consistently agreed with those ones are reported in the literature.
Following similar procedure reported by Nickon et al.\textsuperscript{5}
Benzohydroxamic acid\textsuperscript{6} (3 mmol) was added into a solution of sodium hydroxide (4.5 mmol) in 1.5 mL H\textsubscript{2}O, the mixture was warmed to 50 °C until the solids were dissolved, the resulting solution was added to isopropyl bromide (15 mmol) in absolute ethanol (6 mL), and the mixture was heated to reflux for 5 h. After the reaction was completed, the solvents were removed under reduced pressure. The residue was dissolved in EtOAc (20 mL), washed with H\textsubscript{2}O (15 mL x 2). The organic layer was dried over anhydrous Na\textsubscript{2}SO\textsubscript{4}, filtered, and evaporated under reduced pressure. The crude product was purified by flash column chromatography on silica gel.

**General Procedure C: Synthesis of imino carboxylic acid and analogues**
A solution of amide (0.3 mmol), aldehyde (1.2 mmol), Pd(OAc)\textsubscript{2} (10 mol%), TBHP (1.5 mmol) and BF\textsubscript{3}OEt\textsubscript{2} (40 mol%) in DMSO/Dioxane (V:V = 4:1, 1.5 mL) was heated at 130 °C under air. The reaction was monitored by TLC. After the reaction was completed, the reaction mixture was allowed to cool down to room temperature and EtOAc (20 mL) was added. The resulting mixture was washed with water (10 mL x 3). The organic layer was dried over anhydrous Na\textsubscript{2}SO\textsubscript{4}, filtered and the solvent was removed under reduced pressure to provide the crude product. The purification was performed by flash column chromatography on silica gel.
