General: The reactions were run under argon atmosphere in oven-dried glassware unless otherwise specified. Dichloromethane was distilled from calcium hydride. THF and Et₂O were distilled from sodium/benzophenone. Analytical thin layer chromatography (TLC) was performed on silica gel plates (Merck 60F₂₅₄) visualized either with a UV lamp (254 nm) or by using solutions of p-anisaldehyde/sulfuric acid/acetic acid in EtOH or KMnO₄/K₂CO₃/AcOH in water followed by heating. Flash chromatographies were performed on silica gel (60-230 mesh mesh). All the reactions were carried out under Ar atmosphere. Organic extracts were dried over anhydrous Na₂SO₄. Infrared spectra (IR) were recorded on a Bruker TENSOR™ 27 (IRTF) and wave-numbers are indicated in cm⁻¹. ¹H NMR spectra were recorded on a Bruker AVANCE 400 at 400 MHz in CDCl₃ and data are reported as follows: chemical shift in parts per million from tetramethylsilane as an internal standard, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet or overlap of nonequivalent resonances), integration.¹³C NMR spectra were recorded at 100 MHz in CDCl₃ (unless otherwise specified) and data were reported as follows: chemical shift in parts per million from tetramethylsilane with the solvent as an internal indicator (CDCl₃ δ 77.0 ppm), multiplicity with respect to proton (deduced from DEPT experiments, s = quaternary C, d = CH, t = CH₂, q = CH₃). Mass spectra (MS) were recorded using a Hewlett-Packard tandem 5890A/5971 GCMS (70 eV). High-Resolution Mass Spectra were performed by "Groupe de Spectrométrie de masse de l'Université Pierre et Marie Curie (Paris)". The enantiomeric excesses were determined by supercritical fluid chromatography (SFC) analysis on chiral phase.
**General procedure for the synthesis of the allylic alcohol precursors (Procedure A):** Magnesium chips (6.14 mmol, 1.1 equiv.) and one crystal of I$_2$ were added in THF (2 mL) followed by a few drops of vinyl bromide in order to initiate the reaction. Once discoloration of the medium occurred, the rest of the THF was added followed by the vinyl bromide (5.58 mmol, 1 equiv.), which was added slowly. After stirring for 1 h at room temperature, the medium was cooled to 0 °C and a solution of aldehyde (8.37 mmol, 1.5 equiv.) in THF (5 mL) was added. The mixture was stirred for an additional 30 min at the same temperature before a saturated aqueous solution of NH$_4$Cl (50 mL) was added. The organic layer was then separated and the aqueous phase was extracted twice with Et$_2$O (2 x 20 mL). The combined organic layers were eventually washed with brine (50 mL), dried over anhydrous Na$_2$SO$_4$, filtered and concentrated under reduced pressure. The crude residue was finally purified by flash column chromatography over silica gel to afford the pure allylic alcohol.

**General procedure for the synthesis of the phthalimide precursors (Procedure B):** To a solution of allylic alcohol (4.65 mmol, 1 equiv.) in THF (50 mL) at 0 °C were added triphenylphosphine (5.1 mmol, 1.1 equiv.), phthalimide (5.1 mmol, 1.1 equiv.) and a solution of DEAD (40 % wt in toluene, 6.0 mmol, 1.3 equiv.). The reaction mixture was then stirred for 20 h at room temperature before the solvent was evaporated and the triphenylphosphine oxide precipitated by addition of a 1:1 mixture of Et$_2$O/PE (40 mL). The precipitate was filtered through a plug of Celite® and the solvent was evaporated under reduced pressure to afford a crude residue which was purified by flash column chromatography over silica gel.

**General procedure for the cleavage of the phthalimide (Procedure C):** To a solution of phthalimide (3 mmol, 1 equiv.) in EtOH (26 mL) was added hydrazine hydrate (18 mmol, 6 equiv.) drop-wise and the resulting mixture was stirred at reflux for 3 h. The formed pasty precipitate was then filtered through a plug of Celite®, washed with Et$_2$O (20 mL) and the solvent was evaporated under reduced pressure. The crude residue was finally purified by flash column chromatography over silica gel to afford the desired pure allylic amine.

**General procedure for the kinetic resolution of allylic amines (Procedure D):** To a solution of allylic amine (0.142 mmol, 1 equiv.) in THF (3.4 mL) at −20 °C was added the supported salt (319 mg, 2 equiv.). A solution of (1S,2S)-I (0.071 mmol, 0.5 equiv.) in THF (0.6 mL) was then slowly added during a period of 1 h using a syringe pump and the resulting mixture was stirred overnight at the same temperature. Filtration of the resin followed by evaporation of the solvent and purification of the crude residue by flash column chromatography over silica gel gave the corresponding enantio-enriched acetamide along with the unreacted and enantio-enriched allylic amine.

(E)-3-Methyl-4-phenylbut-3-en-2-ol

MW (g/mol): 162.23  Molecular formula: C_{11}H_{14}O

To a solution of α-methyl-trans-cinnamaldehyde (0.56 mL, 4 mmol, 1.0 equiv.) in THF (40 mL) at 0 °C was added a solution of MeMgBr (3M in Et_{2}O, 2.6 mL, 8 mmol, 2 equiv.) drop-wise. After stirring for 30 min at the same temperature, a saturated aqueous solution of NH_{4}Cl (50 mL) was added. The organic layer was then separated and the aqueous phase was extracted twice with Et_{2}O (2 x 20 mL). The combined organic layers were eventually washed with brine (50 mL), dried over anhydrous Na_{2}SO_{4}, filtered and concentrated under reduced pressure. The crude residue was purified by flash column chromatography over silica gel (Petroleum ether/EtOAc = 85:15) to afford the pure (E)-3-methyl-4-phenylbut-3-en-2-ol in quantitative yield.

3-(4-Methoxyphenyl)but-3-en-2-ol

MW (g/mol): 178.23  Molecular formula: C\textsubscript{11}H\textsubscript{14}O\textsubscript{2}

Methyl lithium (3.2 mL, 1.6M, 5.0mmol) was added to a solution of butynol (393 \(\mu\)L, 5.0 mmol, 1 equiv.) in THF (15 mL) at −78 °C. After stirring for 20 min at the same temperature, the solution was warmed up to rt and ready for use. During this time, ZnCl\textsubscript{2} (4.1 g, 30 mmol, 6.0 equiv.) was weighed to another flask and fused under vacuum. After the flask cooled to rt, Cp\textsubscript{2}Zr(H)Cl (2.5 g,

10 mmol, 2.0 equiv.) and THF (10 mL) were added sequentially. The resulting mixture was stirred until all Cp₂Zr(H)Cl dissolved (solid ZnCl₂ remained suspended). The prepared solution of alkoxide was then transferred via cannula into the mixture of ZnCl₂ and Cp₂Zr(H)Cl in THF, followed by rinsing with THF (5 mL). The result clear solution was stirred for 2h and gave a mixture with some gray precipitate.

After the hydrozirconation, CH₃CN (1mL) and 4-iodoanisole (3.51 g, 15 mmol, 3 equiv.) were added. After 10 min, Pd(PPh₃)₄ (580 mg, 0.50 mmol, 0.1 equiv.) in THF (10 mL) was added and the reaction was stirred overnight. The reaction was quenched with aqueous NH₄Cl and extracted with Et₂O. The combined organic phases were dried over MgSO₄, concentrated and purified by flash chromatography on silica gel to give the pure product (44% yield).

(E)-4-Methyl-1-phenylpent-1-en-3-amine (2h)

MW (g/mol): 175.27  Molecular formula: C₁₂H₁₇N
To a solution of (E)-4-methyl-1-phenylpent-1-en-3-ol (440 mg, 2.5 mmol, 1 equiv.) in CH₂Cl₂ (10 mL) were added TEMPO (75 mg, 0.5 mmol, 0.2 equiv.) and (diacetoxyiodo)benzene (944 mg, 2.87 mmol, 1.15 equiv.). The reaction mixture was stirred for 1.5 h at room temperature until the alcohol was totally oxidized. MeOH (5 mL) was then added followed by ammonium formate (1.61 g, 25 mmol, 10 equiv.) and NaBH₃CN (321 mg, 5.0 mmol, 2.0 equiv.) and the mixture was stirred overnight at rt. The solution was quenched with a 2 M aqueous solution of NaOH (15 mL) and the aqueous phase was extracted twice with CH₂Cl₂ (2 x 30 mL). The combined organic layers were eventually washed with brine (50 mL), dried over anhydrous Na₂SO₄, filtered and concentrated under reduced pressure. The crude residue was purified by flash column chromatography over silica gel (90:10 EtOAc/MeOH) to afford the pure (E)-4-methyl-1-phenylpent-1-en-3-amine in 26% yield.
