ELECTRONIC SUPPORTING INFORMATION

Evidence of Slow Relaxation of Magnetization in Dysprosium-Based Ionic Liquids
Denis Prodios, Fliur Macaev, Yanhua Lan, Ghenadie Novitchi, Serghei Pogrebnoi, Eugenia Stingaci, Valeriu Mereacce, Christopher E. Anson, and Annie K. Powell

Syntheses: All products were analyzed by CHN elemental analysis (Elementar Vario EL analyzer) and infrared spectroscopy (Spectrometer Perkin-Elmer Spectrum One). The water contents were analyzed using a Karl-Fischer-titrator (Metrohm 795 KFT-Titrino).

Synthesis of 1-carboxyethyl-3-methylimidazolium chloride (L1) and 1-carboxyethyl-3-methylimidazolium chloride (L2)
The monocrystals of ligand L1 and L2 were obtained by re-crystallization from water of corresponding imidazolium salts prepared according to [8] (Scheme 1):

**Preparation of dysprosium containing intermediate imidazolium chlorides (ic1 and ic2)**
The dysprosium oxide (3.73 g, 10 mmol) was mixed with L1 or L2 (60 mmol) in 40 ml of water. The mixture was stirred under reflux for 10 hours. The undissolved parts of oxide were filtered off from mother solution and water was evaporated under ambient conditions during next 2-3 days. The white crystalline compound appears from colorless oily product approximately after two weeks.

**Preparation of [Dy(CH3-C6H4-C2H2-CO2H)(H2O)](PF6)2.2H2O (2)**
The intermediate dysprosium containing imidazolium chloride (2.40 g) was dissolved in water (10 ml) and Li[PF6] (2.87 g, 10 mmol) was added at room temperature. The resulting colorless hydrophobic liquid was separated after 5 days by separatory funnel. The product was left for crystallization for next 3-4 weeks. Monitoring by TLC shows the presence of small part of impurities. For further purification of compound, the solid was suspended by stirring at reflux with hexane for 1 hour and filtered off. The procedure should be repeated at least ten times (monitoring by TLC). Yield: 4.4 g (~86 %); hygroscopic, water content = 5.901 %, M.p.: 74 ± 2°C; Tm(esp) = 317 ± 1°C; Anal. calc. for C3H6N2O2Dy: C, 79.92; H, 2.64; N, 5.84; S, 4.06; Found: C, 79.74; H, 2.02; N, 8.56. IR (KBr); /cm⁻¹: 3443 (b, w), 3159 (b, w), 1570 (s), 1458 (m), 1348 (m), 1236 (s, sh), 1323 (s, sh), 1232 (m, sh), 1180 (vs), 1128 (vs), 1058 (vs), 978 (m, sh), 940 (w, sh), 856 (m), 786 (m, sh), 739 (m, sh), 712 (m, sh).

**Preparation of [Dy(CH3-C6H4-C2H2-CO2H)2(H2O)](PF6)2 (3)**
The intermediate dysprosium containing imidazolium chloride (2.40 g) and KPF6 (2.87 g, 10 mmol) were dissolved in water (25 ml) and refluxed for 3 h. After the slow evaporation at ambient temperature, thin crystals appear on the wall of glass and the mixture of thin (3) and rectangular colorless (KCl) crystals on the bottom. Thin crystals were collected and re-crystallized several times from water/EtOH solution. Yield: 0.49 g (~14 %); M.p. (glass transition point): 113 ± 2°C; Tm(esp) = 224 ± 2°C; Anal. calc. for C8H14N2O2DyF3: C, 51.23; H, 3.66; N, 6.62; Found: C, 51.17; H, 3.64; N, 6.56. IR (KBr); /cm⁻¹: 5374 (m, b, w), 5162 (w, b), 2989 (b, w), 2902 (w), 1630 (b, s), 1509 (w), 1452 (w), 1474 (w), 1342 (m), 1342 (s), 1184 (s), 1128 (vs), 1052 (vs), 980 (w), 843 (b, w), 792 (m), 742 (m), 692 (m), 655 (w).

**General procedure for synthesis of ethyl 2-methyl-4-(2-oxo-2,3-dihydro-1H-3-indolyl)-5-phenyl-1H-3-pyrrolocarboxylate (S)**
Ethyl acetocetate (0.001 mol), catalyst (10 mg) and ammonium acetate (0.0025 mol) to the suspension of 3-(2-oxo-2-phenylethylidene)indolin-2-one (0.001 mol) in dry EtOH (4 ml) was added at vigorously stirring. After about 30 min, stirring at reflux (monitoring by TLC) the product was filtered. Analytical sample with m.p. 317-318 °C has been obtained by recrystallization from EtOH. IR (KBr), /cm⁻¹: 3348, 3208, 1702, 1667, 1465, 1101, 698; Anal. calc. for C23H20N2O4S: C, 73.32; H, 5.59; N, 7.77. Found: C, 73.36; H, 5.55; N, 7.70. ¹H NMR (DMSO-d₆, 400.13 MHz), δ, ppm, J/Hz: 0.86 t (3H, Me, J 8.0 Hz), 2.51 s (3H, Me, 3.73 q (2H, CH2, J 8.0 Hz), 6.82-7.55 m (9H, arom.), 10.34 s (1H, NH), 11.63 s (1H, NH). ¹³C NMR (DMSO-d₆, 100.61 MHz), δ, ppm: 178.9, 164.5, 143.4, 137.1, 132.3, 132.1, 129.3, 128.3, 128.2, 127.8, 127.4, 122.9, 121.3, 114.2, 110.2, 109.2, 58.3, 45.2, 14.4, 13.6.
Oxindoles as well as pyrroles are one of the most prevalent heterocyclic compounds, which are present as the basic cores in many potent pharmaceutical compounds, natural products and various kinds of useful materials.\textsuperscript{[15]} Multicomponent reactions continue to be the center of attention for the preparation compounds since three or more molecular building blocks can be combined in one target substance.\textsuperscript{[28]} Extending work on the synthesis of hybrids of both heterocyclic moieties of the title compounds, these were tested as new catalysts to a known\textsuperscript{[13]} synthesis of 2-pyrrolo-3'-yloxindole (5) by a sequential Michael addition followed by Paal–Knorr condensation.

\textbf{Scheme 1.} Synthesis of 2-pyrrolo-3'-yloxindole (5).

![Scheme 1](image)

The functionalized imidazolium salts 1-3 assisted three-component coupling of 3-phenacylideneoxindole (4a), ethyl acetoacetate (4b) and ammonium acetate (4c), was tested. In our case use of ionic liquids 1-3 (10 mg, ~0.15 mol%) catalyze a one-pot reaction with ca 58-99% yield (test with 10 cycles). It should be noted that by increasing the molar ratio of each compound up to 2 mol% only a small change in percentage was seen on. The high purity, good yields and easy separation of 5 by simple filtration, prompted us to investigate the reuse and recycling of our catalysts. After removal of 5, the remainder was directly recycled in subsequent runs. As shown in table S1, the catalysts can be reused at least ten times without significant loss of activity.

\textbf{Table S1:} The recycle of catalysts in synthesis of ethyl 2-methyl-4-(2-oxo-2,3-dihydro-1H-3-indolyl)-5-phenyl-1H-3-pyrrolocarboxylate.
