1. General remarks

Unless otherwise noted, chemicals were purchased from Acros Organics, Alfa Aesar, Aldrich, Lancaster, Merck, Novabiochem or Fluka at the highest purity grade available and were used without further purifications. All solvents were distilled prior to use. Toluene was distilled from appropriate drying agents prior to use and stored under argon atmosphere. The aldehydes were distilled prior to use. All catalytic reactions were carried out under an argon atmosphere employing oven- and flame-dried glassware. Column chromatography and filtration was conducted using Merck silica gel 60 (0.040 – 0.063 mm). TLC Rf values are reported. 1H and 13C NMR spectra were recorded on Bruker AV600, AV400 or AV200 spectrometers, respectively, using TMS as the internal standard with chemical shifts given in ppm relative to TMS or the respective solvent residual peaks. Infrared spectra were recorded on a Bruker IFS25 spectrometer. ESI mass spectra were recorded on a Finnigan LCQDuo spectrometer using methanol solutions of the respective compounds. High resolution ESI mass spectrometry was performed on a Thermo Scientific LTQ FT Ultra hybrid mass spectrometer using methanol solutions of the respective compounds. GC analyses were performed by using Hewlett Packard 5890 and Carlo Erba 2900 gas chromatographs. The analytical HPLC was accomplished by using a Spectra SP 8700 system and the preparative HPLC by using a Knauer system (Knauer Differential-Refractometer, Knauer HPLC Pump 64, Knauer 2151 Variable Wavelength Monitor).

2. Synthesis of peptide A and C

Peptides A and C were synthesized in solution using Boc-strategy and EDC/HOBt mediated couplings as described in the literature. Analytical data of the peptides A and C were identical with those reported in the literature.[1],[2]

3. Availability of the aldehydes and racemic starting materials

The achiral aldehydes were purchased and distilled prior to use. Racemic trans-cyclopentane-1,2-diol (rac-1a) was purchased from Aldrich (97% purity) and used without further purification. Racemic trans-cyclohexane-1,2-diol (rac-1b) was purchased from Acros Organics (98% purity). Trans-cycloheptane-1,2-diol (rac-1c) was synthesized according to the method of the Organikum[3] using freshly distilled cycloheptene (purchased from Aldrich, 92% purity), formic acid, H2O2 followed by a saponification with aq. NaOH. Trans-cyclooctane-1,2-diol (rac-1d) was synthesized via epoxide opening of cyclooctaneoxide (purchased from Alfa Aesar, 99% purity) in water with p-toluenesulfonic acid.[2]

4. Description of the catalytic experiments for the variation of the acids (Table 1)

Exemplary Description of Standard Conditions for Catalytic Runs provided in Table 1:

The acids 7a–f (0.11 mmol) and TEMPO B (0.8 mg, 5 μmol, 5 mol%) were suspended in 100 μL dry toluene. Additionally propanal (7.2 μL, 0.10 mmol) and pyridine (8.1 μL, 0.10 mmol) were added via an Eppendorf pipette. The reaction mixture was cooled to 0 °C and 1.05 equiv.
of $t$-butyl hypochlorite (0.105 mmol) were then added with an Eppendorf pipette and allowed to stir for 1 h at 0 °C. After completion of the oxidation of aldehyde the reaction was diluted with 20 mL dry toluene and cooled to 0 °C. Catalyst C (3.8 mg, 5 μmol, 5 mol%) and trans-cyclohexan-1,2-diol (11.6 mg, 0.10 mmol) were added followed by DiPEA (17 μL, 0.10 mmol). The mixture was stirred for 24 h, quenched with methanol and directly analyzed by chiral GC.

**Data for diol (rac-1b):**

![Picture of diol](image)

See chapter 7.

**Data for monopropionate (rac-6b):**

![Picture of monopropionate](image)

See chapter 7.

5. Identification of mixed anhydrides of propionic acid and 4-nitrobenzoic acid by NMR

The mixed anhydrides were prepared by two independent methods as described in the literature.\[^4\] The first preparation involved starting from propanal and 4-nitrobenzoic acid. In the other method the same anhydride was synthesized by treating propionic acid chloride with 4-nitrobenzoic acid in the presence of pyridine. A sample of the reaction mixtures was withdrawn and submitted to NMR spectroscopy.

**a)** Synthesis of the mixed anhydride from propionic acid chloride and 4-nitrobenzoic acid:

Propionic acid chloride (87 μL, 1.0 mmol) and 4-nitrobenzoic acid (185 mg, 1.1 mmol) were dissolved in 1 mL dichloromethane. Pyridine (0.1 mL, 1.3 equiv.) was added drop wise. A precipitate formed immediately. The mixture was concentrated by a stream of argon and a portion of the precipitate subjected to $^1$H and $^{13}$C NMR spectroscopy.

**b)** Synthesis of the anhydride from propanal and 4-nitrobenzoic acid:

Propanal (72 μL, 1.0 mmol), TEMPO (3.1 mg, 0.02 mmol, 2 mol%), 4-nitrobenzoic acid (185 mg, 1.1 mmol) and pyridine (0.08 mL, 1.0 mmol) were dissolved in 1 mL dry toluene-$d_8$. $t$-BuOCl (1.05 mmol) was added at 0 °C. After 1 h the oxidation was complete and no starting material could be detected by GC-MS. The reaction mixture was stirred for another hour, 0.7 mL were filtered into a NMR tube and the $^1$H and $^{13}$C NMR were recorded.

6. Time-resolved NMR investigations with 2,4,6-trichlorobenzoic acid

Exemplary Description of Standard Conditions for NMR investigations:

2,4,6-Trichlorobenzoic acid (124 mg, 0.55 mmol) and TEMPO (1.6 mg, 10 μmol, 2 mol%) were suspended in 500 μL dry toluene-d₈ in a argon filled Young NMR tube. The aldehyde (0.50 mmol) and pyridine (40 μL, 0.50 mmol) were added via Eppendorf pipette. The reaction mixture was cooled to 0 °C and 1.05 equiv. of isobutyl hypochlorite (0.53 mmol) were added with an Eppendorf pipette. The reaction process was monitored by ¹H NMR.

7. Description of the preparative experiments with trans-cycloalkane-1,2-diols (Table 2)

Description of Standard Conditions for Catalytic Runs

The conditions for the kinetic resolutions of trans-cyclopentane-1,2-diol (rac-1a), trans-cyclohexane-1,2-diol (rac-1b), trans-cycloheptane-1,2-diol (rac-1c) and trans-cyclooctane-1,2-diol (rac-1d) with propanal 4a are given exemplarily by the following experimental protocol. 4-nitrobenzoic acid (185 mg, 1.1 mmol) and TEMPO (8 mg, 50 μmol, 5 mol%) were suspended in 1 mL dry toluene. Propanal (72 μL, 1.0 mmol) and 81 μL pyridine (1.0 mmol) were added via Eppendorf pipette. The reaction mixture was cooled to 0 °C and 1.05 equiv. of t-butyl hypochlorite (1.05 mmol) were then added with an Eppendorf pipette and allowed to stir for 1 h at 0 °C. After completion of the oxidation of aldehyde to the mixed anhydride the reaction was diluted with 200 mL dry toluene and cooled to 0 °C. Catalyst C (38 mg, 50 μmol, 5 mol%) and trans-cycloalkane-1,2-diol (1.0 mmol) were added followed by DiPEA (170 μL, 1.0 mmol). The reaction mixture was quenched with 10 mL methanol and then filtered through 30 g silica gel suspended with EtOAc to remove the catalyst (the silica gel was washed with EtOAc). Purification methods were different for each synthesis and can be found in the corresponding paragraph (see below).

Data for the preparative kinetic resolution of rac-1b with 4a:

Purification:
After the filtration the solvents were removed under reduced pressure. The crude product was directly purified by silica gel column chromatography. Eluting with DCM/MeOH/Et3N 95:5:0.1 afforded 74 mg (0.43 mmol, 43%) of monopropionate 6b (Rf = 0.59) and 53 mg (0.46 mmol, 46%) of diol 1b (Rf = 0.20). The products were then directly characterized by chiral GC analysis, chiral HPLC analysis and NMR.

Data for diol 1b:

Diol rac-1b was purchased from Acros Organics at the highest purity grade available and was used without further purifications.

Assay of enantiomeric purity.
Enantiomers of diol 1b were separated by chiral GC employing a 30 m FS-Hydrodex γ-DiMOM column (Macherey-Nagel).
T (Injector + Detector) = 250 °C
Splitflow = 80 mL/min
Precolumn pressure = 0.8 bar
Conditions: 100 °C – 240 °C, 10 °C/min
Retention Times: R1 (S,S) = 28.5 min; R2 (R,R) = 27.9 min
Data for monopropionate 6b:

Assay of enantiomeric purity.
Enantiomers of monoacetate 6b were separated by chiral GC employing a 30 m FS-Hydrodex γ-DiMO column (Macherey-Nagel).
T (Injector + Detector) = 250 °C
Splitflow = 80 mL/min
Precolumn pressure = 0.8 bar
Conditions: 100 °C – 240 °C, 10 °C/min
Retention Times: R₁ (S,S) = 36.7 min; R₂ (R,R) = 36.9 min

Proof of GC retention times for 6b:
Racemic trans-cyclohexane-1,2-diol (rac-1b) (0.345 g, 3.0 mmol) was treated with propionic anhydride (371 µL, 4.0 mmol) in the presence of N,N-dimethylaminopyridine (0.073 g, 0.6 mmol) in 20 mL dichloromethane and the resulting solution was stirred for 3 h at room temperature (25 °C). Dichloromethane was then removed in vacuo, and the monopropionate (rac-6b) was purified by silica flash gel chromatography (EtOAc, Rf (6b) = 0.59). Isolated rac-6b was characterized and then subjected to the GC assay described above to proof the origin of the GC signals.

Analytical data of the product (rac-6b) were identical with those reported in the literature.[5]

Data for the preparative kinetic resolution of rac-1a with 4a:

Purification:
The quenched reaction mixture was directly analyzed by chiral GC without further purification.

Data for diol 1a:

Diol rac-1a was purchased from Acros Organics at the highest purity grade available and was used without further purifications.

Assay of enantiomeric purity.
Enantiomers of diol 1a were separated by chiral GC employing a 30 m FS-Hydrodex β-6TBDAc column (Macherey-Nagel).
T (Injector + Detector) = 250 °C
Splitflow = 80 mL/min
Precolumn pressure = 0.8 bar
Conditions: 100 °C – 180 °C, 2 °C/min
Retention Times: R₁ (S,S) = 26.7 min; R₂ (R,R) = 27.2 min
Data for monopropionate 6a:

Assay of enantiomeric purity.
Enantiomers of monoacetate 6a were separated by chiral GC employing a 30 m FS-Hydrodex β-6TBDAc column (Macherey-Nagel).
T (Injector + Detector) = 250 °C
Splitflow = 80 mL/min
Precolumn pressure = 0.8 bar
Conditions: 100 °C – 180 °C, 2 °C/min
Retention Times: R1 (S, S) = 19.0 min; R2 (R, R) = 18.6 min

Proof of GC retention times for 6a:
Racemic trans-cyclopentane-1,2-diol (rac-1a) (0.306 g, 3.0 mmol) was treated with propionic anhydride (371 μL, 4.0 mmol) in the presence of N,N-dimethylaminopyridine (0.073 g, 0.6 mmol) in 20 mL dichloromethane and the resulting solution was stirred for 3 h at room temperature (25 °C). Dichloromethane was then removed in vacuo, and the monopropionate (rac-6a) was purified by silica flash gel chromatography (EtOAc, Rf (6a) = 0.60). Isolated rac-6a was characterized and then subjected to the GC assay described above to proof the origin of the GC signals.

Analytical data:
1H NMR (400 MHz, CDCl3): δ/ppm = 4.83 – 4.77 (m, 1 H); 4.11 – 4.02 (m, 1 H); 3.01 – 2.92 (m, 1 H); 2.40 – 2.29 (q, J = 7.7 Hz, 2 H); 2.17 – 2.06 (m, 1 H), 2.06 – 1.95 (m, 1 H); 1.85 – 1.57 (m, 4 H); 1.19 – 1.09 (t, J = 7.7 Hz, 3 H).
13C NMR (150 MHz, CDCl3): δ/ppm = 175.7; 83.7; 32.5; 30.0; 27.7; 21.7; 21.6; 9.1.
IR (KBr): ʋ/cm⁻¹ = 3443; 2945; 2882; 1736; 1463; 1350; 1276; 1194; 1090; 1038.
HR-MS (ESI): m/z = 181.0835 [M+Na]+ (calc. m/z = 181.0835).

Data for the preparative kinetic resolution of rac-1c with 4a:

Purification:
After the filtration the solvents were removed under reduced pressure. The crude product was directly purified by silica gel column chromatography. Eluting with 5% MeOH/DCM afforded 79 mg (0.43 mmol, 43%) of monopropionate 6a (Rf = 0.53) and 63 mg (0.48 mmol, 48%) of diol 1a (Rf = 0.14). The products were then directly characterized by chiral GC analysis, chiral HPLC analysis and NMR.

Data for diol 1c:

Diol rac-1c was synthesized as described in chapter 3.
Assay of enantiomeric purity.
Enantiomers of diol 1c were separated by chiral GC employing a 30 m FS-Hydrodex β-6TBDM column (Macherey-Nagel).
T (Injector + Detector) = 250 °C
Splitflow = 80 mL/min
Precolumn pressure = 0.8 bar
Conditions: 140 °C isotherm
Retention Times: R₁ (S,S) = 10.4 min; R₂ (R,R) = 11.0 min

Data for monopropionate 6c:

Assay of enantiomeric purity.
Enantiomers of monoacetate 6c were separated by chiral HPLC employing a Chiralpak IA column (Daicel).
Eluent: Hexane/2-Propanol 90:10
Flow: 1.00 ml/min.
UV-detector λ = 220 nm and refractometer
Retention Times: R₁ (S,S) = 10.3 min; R₂ (R,R) = 13.0 min

Proof of HPLC retention times for 6c:
Racemic trans-cycloheptane-1,2-diol (rac-1c) (0.390 g, 3.0 mmol) was treated with propionic anhydride (371 μL, 4.0 mmol) in the presence of N,N-dimethylaminopyridine (0.073 g, 0.6 mmol) in 20 mL dichloromethane and the resulting solution was stirred for 3 h at room temperature (25 °C). Dichloromethane was then removed in vacuo, and the monopropionate (rac-6c) was purified by silica flash gel chromatography (EtOAc, Rf (6c) = 0.46). Isolated rac-6c was characterized and then subjected to the HPLC assay described above to proof the origin of the HPLC signals.

Analytical data:
1H NMR (400 MHz, CDCl₃): δ/ppm = 4.75 – 4.67 (m, 1 H); 3.78 – 3.70 (m, 1 H); 2.75 – 2.69 (s, 1 H); 2.42 – 2.32 (q, J = 7.5, 2 H); 1.91 – 1.44 (m, 10 H); 1.19 – 1.11 (t, J = 7.5 Hz, 1 H).
13C NMR (150 MHz, CDCl₃): δ/ppm = 175.1; 81.8; 75.9; 32.8; 30.3; 28.3; 27.9; 23.0; 22.8; 9.3.
IR (KBr): ν/cm⁻¹ = 3449; 2935; 2863; 1734; 1461; 1369; 1275; 1200; 1082; 1028.
HR-MS (ESI): m/z = 209.1148 [M+Na]+ (calc. m/z = 209.1148).

Data for the preparative kinetic resolution of rac-1d with 4a:

Purification:
After the filtration the solvents were removed under reduced pressure. The crude product was directly purified by silica gel column chromatography. Eluting with EtOAc afforded 95 mg (0.47 mmol, 47%) of monopropionate 6d (Rf = 0.80) and 56 mg (0.39 mmol, 39%) of diol 1d (Rf = 0.24). The products were then directly characterized by chiral GC analysis, chiral HPLC analysis and NMR.
Data for diol 1d:

Diol rac-1d was synthesized as described in chapter 3.

Assay of enantiomeric purity.
Enantiomers of diol 1d were separated by chiral GC employing a 30 m FS-Hydronex β-6TBDM column (Macherey-Nagel).
T (Injector + Detector) = 250 °C
Splitflow = 80 mL/min
Precolumn pressure = 0.8 bar
Conditions: 80 °C – 130 °C, 0.4 °C/min
Retention Times: R<sub>1</sub> (S,S) = 105.9 min; R<sub>2</sub> (R,R) = 107.1 min

Data for monopropionate 6d:

Assay of enantiomeric purity.
Enantiomers of monoacetate 6d were separated by chiral HPLC employing a Chiralpak IA column (Daicel).
Eluent: Hexane/2-Propanol 90:10
Flow: 1.00 ml/min.
UV-detector λ = 220 nm and refractometer
Retention Times: R<sub>1</sub> (S,S) = 16.4 min; R<sub>2</sub> (R,R) = 16.9 min

Proof of HPLC retention times for 6d:
Racemic trans-cyclooctane-1,2-diol (rac-1d) (0.432 g, 3.0 mmol) was treated with propionic anhydride (371 μL, 4 mmol) in the presence of N,N-dimethylaminopyridine (0.073 g, 0.6 mmol) in 20 mL dichloromethane and the resulting solution was stirred for 3 h at room temperature (25 °C). Dichloromethane was then removed in vacuo, and the monopropionate (rac-6d) was purified by silica flash gel chromatography (EtOAc, R<sub>f</sub> (6d) = 0.80). Isolated rac-6d was characterized and then subjected to the HPLC assay described above to proof the origin of the HPLC signals.

Analytical data:
<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): δ/ppm = 5.10 – 5.01 (m, 1 H); 3.99 – 3.92 (m, 1 H); 2.42 – 2.29 (m, 3 H); 2.13 – 2.00 (m, 1 H); 1.85 – 1.48 (m, 11 H); 1.19 – 1.11 (t, J = 7.6 Hz, 3 H).
<sup>13</sup>C NMR (150 MHz, CDCl<sub>3</sub>): δ/ppm = 174.1; 76.8; 71.7; 30.3; 27.9; 27.8; 27.0; 25.5; 24.5; 21.8; 9.1.
IR (KBr): ā/cm<sup>-1</sup> = 3456; 2929; 2861; 1732; 1463; 1359; 1277; 1191; 1081; 1030.
HR-MS (ESI): m/z = 223.1303 [M+Na]<sup>+</sup> (calc. m/z = 223.1305).
8. Description of the preparative experiments with trans-cyclohexane-1,2-diol using the aldehydes 4b–i (Table 3)

The conditions for the preparative kinetic resolution of 7a with 4b–i are given exemplary by the following experimental protocol [Values in blue: double amount of generated anhydride].

4-nitrobenzoic acid (185 mg, 1.1 mmol) [368 mg, 2.2 mmol] and TEMPO (8 mg, 50 μmol, 5 mol%) [16 mg, 100 μmol, 5 mol%] were suspended in 1 mL [2 mL]* dry toluene. Additionally the aldehyde (1.0 mmol) [2 mmol] and 81 μL (1.0 mmol) [162 μL, 2.0 mmol] pyridine were added via Eppendorf pipette. The reaction mixture was cooled to 0 °C and 1.05 equiv. of t-butyl hypochlorite (1.05 mmol) [2.1 mmol] was then added with an Eppendorf pipette and allowed to stir 1 h at 0 °C. After completion of the oxidation and conversion of the aldehyde to the mixed anhydride the reaction mixture was filled up to 200 mL with dry toluene and cooled to 0 °C. Catalyst B (38 mg, 50 µmol, 5 mol%) and trans-cycloalkane-1,2-diol (116 mg, 1.0 mmol) were added in one portion followed by D3PEA (170 µL, 1.0 mmol) [340 µL, 2.0 mmol]. The reaction mixture was quenched with 10 mL methanol and then filtered using 30 g silica gel suspended with EtOAc to remove the catalyst (the silica gel was washed with EtOAc). Purification methods were different for each synthesis and can be found in the corresponding paragraph (see below).

* For aldehydes 4g–i a solvent volume of 20 mL was used.

Data for the preparative kinetic resolution of racemic 1b with 4b:

Purification:

After the filtration the solvents were removed under reduced pressure. The crude product was directly purified by silica gel column chromatography. Eluting with DCM/MeOH/Et3N 95:5:0.1 afforded 113 mg (0.42 mmol, 42%) of monoprotected diol 9b (Rf = 0.67) and 56 mg (0.48 mmol, 48%) of diol 1b (Rf = 0.20). The products were then directly characterized by chiral GC analysis and NMR.

Data for monodecanoate 9b:

Assay of enantiomeric purity.

Enantiomers of monoprotected diol 9b were separated by chiral HPLC employing a Chiralpack IC column (Daicel).

Eluent: Hexane/2-Propanol 95:5
Flow: 1 mL/min
UV-detector λ = 220 nm and refractometer
Retention Times: R₁ (S,S) = 12.8 min; R₂ (R,R) = 13.5 min

Proof of HPLC retention times for 9b:

4-nitrobenzoic acid (185 mg, 1.1 mmol) and TEMPO (8 mg, 50 μmol, 5 mol%) were suspended in 1 mL dry toluene. Additionally the aldehyde (1.0 mmol) and 81 μL (1.0 mmol) pyridine were added via Eppendorf pipette. The reaction mixture was cooled to 0 °C and 1.05 equiv. of t-butyl hypochlorite (1.05 mmol) was then added with an Eppendorf pipette and allowed to stir 1 h at 0 °C. 4-(Dimethylamino)-pyridine (12 mg, 0.1 mmol, 10 mol%) and
trans-cycloalkan-1,2-diol (116 mg, 1.0 mmol) were added in one portion followed by DiPEA (170 μL, 1.0 mmol) and stirred at rt. 6 h. The solvents were then removed in vacuo, and rac-9b was purified by silica flash gel chromatography (Hexane/Et₂O/Et₃N 1:1:0.1, Rₜ (9b) = 0.28). Isolated rac-9b was characterized and then subjected to the HPLC assay described above to proof the origin of the HPLC signals.

Analytical data:

$$^1$$H NMR (400 MHz, CDCl₃): δ/ppm = 4.64 – 4.52 (m, 1 H); 3.61 – 3.51 (m, 1 H); 2.39 – 2.28 (t, J = 7.8 Hz, 2 H); 2.13 – 1.98 (m, 2 H); 1.94 – 1.89 (s, 1 H); 1.78 – 1.68 (m, 2 H); 1.67 – 1.57 (m, 2 H); 1.40 – 1.20 (m, 16 H); 0.94 – 0.82 (t, J = 7.8 Hz, 3 H).

$$^{13}$$C NMR (150 MHz, CDCl₃): δ/ppm = 174.3; 78.1; 73.0; 34.7; 33.1; 31.9; 29.4; 29.3; 25.1; 23.9; 23.8; 22.7; 14.2.

IR (KBr): ν/cm⁻¹ = 3452; 2928; 2856; 1735; 1454; 1351; 1248; 1076; 1020; 852.

HR-MS (ESI): m/z = 293.2088 [M+Na]+ (calc. m/z = 293.2087).

Data for the preparative kinetic resolution of racemic 1b with 4c:

Purification:
After the filtration the solvents were removed under reduced pressure. The crude product was directly purified by silica gel column chromatography. Eluting with DCM/MeOH/Et₃N 95:5:0.1 afforded 86 mg (0.43 mmol, 43%) of monoprotected diol 9c (Rₜ = 0.77) and 53 mg (0.46 mmol, 46%) of diol 1b (Rₜ = 0.20). The products were then directly characterized by chiral GC analysis and NMR.

Data for monoisovalerate 9c:

Assay of enantiomeric purity.
Enantiomers of monoprotected diol 9c were separated by chiral HPLC employing a Chiralpack IC column (Daicel).
Eluent: Hexane/2-Propanol 90:10
Flow: 1 mL/min
UV-detector λ = 220 nm and refractometer
Retention Times: R₁ (S,S) = 7.8 min; R₂ (R,R) = 8.4 min

Proof of HPLC retention times for 9c:
4-nitrobenzoic acid (185 mg, 1.1 mmol) and TEMPO (8 mg, 50 μmol, 5 mol%) were suspended in 1 mL dry toluene. Additionally the aldehyde (1.0 mmol) and 81 μL (1.0 mmol) pyridine were added via Eppendorf pipette. The reaction mixture was cooled to 0 °C and 1.05 equiv. of t-butyl hypochlorite (1.05 mmol) was then added with an Eppendorf pipette and allowed to stir 9 h at 0 °C. 4-(Dimethylamino)-pyridine (12 mg, 0.1 mmol, 10 mol%) and trans-cycloalkan-1,2-diol (116 mg, 1.0 mmol) were added in one portion followed by DiPEA (170 μL, 1 mmol) and stirred at rt. 6 h. The solvents were then removed in vacuo, and rac-9c was purified by silica flash gel chromatography (Hexane/Et₂O/Et₃N 3:7:0.1, Rₜ (9c) = 0.40). Isolated rac-9c was characterized and then subjected to the HPLC assay described above to proof the origin of the HPLC signals.

Data for the preparative kinetic resolution of racemic 1b with 4d:

**Purification:**
After the filtration the solvents were removed under reduced pressure. The crude product was directly purified by silica gel column chromatography. Eluting with DCM/MeOH/Et\(_3\)N 95:5:0.1 afforded 75 mg (0.40 mmol, 40%) of monoprotected diol 9d (\( R_f = 0.79 \)) and 50 mg (0.43 mmol, 43%) of diol 1b (\( R_f = 0.20 \)). The products were then directly characterized by chiral GC analysis and NMR.

**Data for monoisobutyrate 9d:**

![Diagram of 9d](image)

**Assay of enantiomeric purity.**
Enantiomers of diol 9d were separated by chiral GC employing a 30 m FS-Hydrodex \( \gamma \)-DiMOM column (Macherey-Nagel).

\( T (\text{Injector + Detector}) = 250 \ \degree C \)

\( \text{Splitflow} = 80 \text{ mL/min} \)

\( \text{Precolumn pressure} = 0.8 \text{ bar} \)

**Conditions:** 100 \( \degree C \) – 240 \( \degree C \), 10 \( \degree C/\text{min} \)

**Retention Times:** \( R_1 (S,S) = 37.1 \text{ min}; \ R_2 (R,R) = 37.2 \text{ min} \)

**Proof of HPLC retention times for 9d:**
4-nitrobenzoic acid (185 mg, 1.1 mmol) and TEMPO (8 mg, 50 \( \mu \)mol, 5 mol%) were suspended in 1 mL dry toluene. Additionally the aldehyde (1.0 mmol) and 81 \( \mu \)L (1.0 mmol) pyridine were added via Eppendorf pipette. The reaction mixture was cooled to 0 \( \degree C \) and 1.05 equiv. of \( t \)-butyl hypochlorite (1.05 mmol) was then added with an Eppendorf pipette and allowed to stir 18 h at 0 \( \degree C \). 4-(Dimethylamino)-pyridine (12 mg, 0.1 mmol, 10 mol%) and \( \text{trans-cycloalkan-1,2-diol} \) (116 mg, 1.0 mmol) were added in one portion followed by \( \text{DiPEA} \) (170 \( \mu \)L, 1.0 mmol) and stirred at rt 6 h. The solvents were then removed \( \text{in vacuo} \), and \( \text{rac-9d} \) was purified by silica flash gel chromatography (Hexane/\( \text{Et}_2\)O/Et\(_3\)N 3:7:0.1, \( R_f (9d) = 0.29 \)). Isolated \( \text{rac-9d} \) was characterized and then subjected to the HPLC assay described above to proof the origin of the HPLC signals.

Analytical data of the monoacylated product (\( \text{rac-9d} \)) were identical with those reported in the literature.\(^{16} \)
Data for the preparative kinetic resolution of racemic 1b with 4e:

**Purification:**
After the filtration the solvents were removed under reduced pressure. The crude product was directly purified by silica gel column chromatography. Eluting with DCM/MeOH/Et₃N 95:5:0.1 afforded 79 mg (0.35 mmol, 35%) of monoprotected diol 9e (Rᵣ = 0.75) and 43 mg (0.37 mmol, 37%) of diol 1b (Rᵣ = 0.20). The products were then directly characterized by chiral GC analysis and NMR.

Data for monocyclohexanecarboxylate 9e:

Assay of enantiomeric purity.
Enantiomers of monoprotected diol 9e were separated by chiral HPLC employing a Chiralpack IC column (Daicel).
Eluent: Hexane/2-Propanol 90:10
Flow: 1 mL/min
UV-detector λ = 220 nm and refractometer
Retention Times: R₁ (S,S) = 9.2 min; R₂ (R,R) = 9.8 min

Proof of HPLC retention times for 9e:
4-nitrobenzoic acid (185 mg, 1.1 mmol) and TEMPO (8 mg, 50 μmol, 5 mol%) were suspended in 1 mL dry toluene. Additionally the aldehyde (1.0 mmol) and 81 μL (1.0 mmol) pyridine were added via Eppendorf pipette. The reaction mixture was cooled to 0 °C and 1.05 equiv. of t-butyl hypochlorite (1.05 mmol) was then added with an Eppendorf pipette and allowed to stir 18 h at 0 °C. 4-(Dimethylamino)-pyridine (12 mg, 0.1 mmol, 10 mol%) and trans-cycloalkan-1,2-diol (116 mg, 1.0 mmol) were added in one portion followed by DipeA (170 μL, 1.0 mmol) and stirred at rt. 6 h. The solvents were then removed in vacuo, and rac-9e was purified by silica flash gel chromatography (Hexane/Et₂O/Et₃N 3:7:0.1, Rᵣ(9e) = 0.43). Isolated racemic rac-9e was characterized and then subjected to the HPLC assay described above to proof the origin of the HPLC signals.

Analytical data:

$^1$H NMR (400 MHz, CDCl₃): δ/ppm = 4.63 – 4.49 (m, 1 H); 3.64 – 4.48 (m, 1 H); 2.44 – 2.28 (m, 1 H); 2.14 – 1.87 (m, 5 H); 1.82 – 1.61 (m, 5 H); 1.50 – 1.24 (m, 8 H).

$^{13}$C NMR (150 MHz, CDCl₃): δ/ppm = 176.5; 77.8; 72.9; 43.4; 33.0; 29.9; 29.1; 29.0; 25.7; 25.4; 23.9; 23.7.

IR (KBr): ν/cm⁻¹ = 3451; 2934; 2858; 1729; 1451; 1379; 1248; 1174; 1039; 733.

HR-MS (ESI): m/z = 249.1461 [M+Na]$^+$ (calc. m/z = 249.1461).

Data for the preparative kinetic resolution of racemic 1b with 4f:

Data for monopivalate 9f:
Assay of enantiomeric purity.
Enantiomers of diol 9f were separated by chiral GC employing a 30 m FS-Hydrodex γ-DiMOM column (Macherey-Nagel).
T (Injector + Detector) = 250 °C
Splitflow = 80 mL/min
Precolumn pressure = 0.8 bar
Conditions: 100 °C, 30 min; 100 °C – 240 °C, 5 °C/min
Retention Times: R1 (S,S) = 40.3 min; R2 (R,R) = 40.4 min

Proof of GC retention times for 8e:
Racemic trans-cyclohexane-1,2-diol (rac-1b) (0.345 g, 3.0 mmol) was treated with pivalic anhydride (811 μL, 4.0 mmol) in the presence of N,N-dimethylaminopyridine (0.073 g, 0.6 mmol) in 20 mL dichloromethane and the resulting solution was stirred for 3 h at room temperature (25 °C). Dichloromethane was then removed in vacuo, and the monoprotected (rac-9f) was purified by silica flash gel chromatography. Isolated rac-9f was characterized and then subjected to the GC assay described above to proof the origin of the GC signals.

Analytical data of the monoacylated product (rac-9f) were identical with those reported in the literature.[7]

Data for the preparative kinetic resolution of racemic 1b with 4g:
Purification:
After the filtration the solvents were removed under reduced pressure. The crude product was directly purified by silica gel column chromatography. Eluting with DCM/MeOH/Et3N 95:5:0.1 afforded 109 mg (0.44 mmol, 44%) of monoprotected diol 4g (Rf = 0.80) and 51 mg (0.44 mmol, 44%) of diol 1b (Rf = 0.20). The products were then directly characterized by chiral GC analysis and NMR.

Data for monophenylpropionate 9g:

Assay of enantiomeric purity.
Enantiomers of monoprotected diol 9g were separated by chiral HPLC employing a Chiralpack IB column (Daicel).
Eluent: Hexane/2-Propanol 90:10
Flow: 0.7 mL/min
UV-detector λ = 220 nm and refractometer
Retention Times: R1 (S,S) = 11.1 min; R2 (R,R) = 9.4 min
Proof of HPLC retention times for 9g:
4-nitrobenzoic acid (185 mg, 1.1 mmol) and TEMPO (8 mg, 50 μmol, 5 mol%) were suspended in 20 mL dry toluene. Additionally the aldehyde (1.0 mmol) and 81 μL (1.0 mmol) pyridine were added via Eppendorf pipette. The reaction mixture was cooled to 0 °C and 1.05 equiv. of t-butyl hypochlorite (1.05 mmol) was then added with an Eppendorf pipette and allowed to stir 18 h at 0 °C. 4-(Dimethylamino)-pyridine (12 mg, 0.1 mmol, 10 mol%) and trans-cycloalkan-1,2-diol (116 mg, 1.0 mmol) were added in one portion followed by DiPEA (170 μL, 1.0 mmol) and stirred at rt 6 h. The solvents were then removed in vacuo, and (±)-8f was purified by silica flash gel chromatography (Hexane/Et2O/Et3N 3:7:0.1, Rf (9g) = 0.64). Isolated rac-9g was characterized and then subjected to the HPLC assay described above to proof the origin of the HPLC signals.

Analytical data:
$^1$H NMR (400 MHz, CDCl3): δ/ppm = 7.33 – 7.19 (m, 5 H); 4.62 – 4.46 (m, 1 H); 3.05 – 2.09 (t, J = 7.6 Hz, 2 H); 2.75 – 2.62 (t, J = 7.6 Hz, 2 H); 2.07 – 1.91 (m, 2 H); 1.77 – 1.63 (m, 2 H); 1.39 – 1.15 (m, 4 H).
$^{13}$C NMR (150 MHz, CDCl3): δ/ppm = 173.1; 140.4; 128.6; 128.3; 126.4; 78.4; 72.6; 36.1; 32.8; 31.1; 30.0; 23.9; 23.8.
IR (KBr): $\tilde{\nu}$/cm$^{-1}$ = 3446; 2939; 2863; 1730; 1453; 1371; 1288; 1263; 1181; 1077; 1009; 912; 733; 699.
HR-MS (ESI): m/z = 271.1306 [M+Na]$^+$ (calc. m/z = 271.1305).

Data for the preparative kinetic resolution of racemic 1b with 4h:

Purification:
After the filtration the solvents were removed under reduced pressure. The crude product was directly purified by silica gel column chromatography. Eluting with DCM/MeOH/Et3N 95:5:0.1 afforded 63 mg (0.27 mmol, 27%) of monoprotected diol 9h (Rf = 0.82) and 67 mg (0.58 mmol, 58%) of diol 1b (Rf = 0.20). The products were then directly characterized by chiral GC analysis and NMR.

Data for monophenylacetate 9h:

Assay of enantiomeric purity.
Enantiomers of monoprotected diol 9h were separated by chiral HPLC employing a Chiralpack IB column (Daicel). Eluent: Hexane/2-Propanol 90:10 Flow: 0.7 mL/min UV-detector λ = 220 nm and refractometer Retention Times: R1 ($S_S$) = 14.0 min; Rf ($R_R$) = 10.7 min

Proof of HPLC retention times for 9h:
4-nitrobenzoic acid (185 mg, 1.1 mmol) and TEMPO (8 mg, 50 μmol, 5 mol%) were suspended in 20 mL dry toluene. Additionally the aldehyde (1.0 mmol) and 81 μL (1.0
mmol) pyridine were added via Eppendorf pipette. The reaction mixture was cooled to 0 °C and 1.05 equiv. of t-butyl hypochlorite (1.05 mmol) was then added with an Eppendorf pipette and allowed to stir 18 h at 0 °C. 4-(Dimethylamino)-pyridine (12 mg, 0.1 mmol, 10 mol%) and trans-cycloalkan-1,2-diol (116 mg, 1.0 mmol) were added in one portion followed by DiPEA (170 μL, 1.0 mmol) and stirred at rt 6 h. The solvents were then removed in vacuo, and rac-9h was purified by silica flash gel chromatography (Hexane/EtO/Et3N 3:7:0.1, Rf (9h) = 0.64). Isolated rac-9h was characterized and then subjected to the HPLC assay described above to proof the origin of the HPLC signals. Analytical data of the monoacylated product (rac-9h) were identical with those reported in the literature.[5]

Data for the preparative kinetic resolution of racemic 1b with 4i:

Data for monobenzoate 9i:

Assay of enantiomeric purity.
Enantiomers of monoprotected diol 9i were separated by chiral GC employing a 30 m FS-Hydrodex β - TBDAc column (Macherey-Nagel). T (Injector + Detector) = 250 °C Splitflow = 80 mL/min Precolumn pressure = 0.8 bar Conditions: 100 °C – 200 °C, 1.4 °C/min Retention Times: R1 (S,S) = 70.3 min; R2 (R,R) = 70.5 min

Proof of GC retention times for 9i:
Racemic trans-cyclohexane-1,2-diol (rac-1b) (0.345 g, 3.0 mmol) was treated with benzoic anhydride (755 μL, 4.0 mmol) in the presence of N,N-dimethylaminopyridine (0.073 g, 0.6 mmol) in 20 mL dichloromethane and the resulting solution was stirred for 3 h at room temperature (25 °C). Dichloromethane was then removed in vacuo, and the monoprotected (rac-9i) was purified by silica flash gel chromatography. Isolated rac-9i was characterized and then subjected to the GC assay described above to proof the origin of the GC signals. Analytical data of the monoacylated product (rac-9i) were identical with those reported in the literature.[8]
9. Description of the preparative experiments with multicatalyst C

4-nitrobenzoic acid (185 mg, 1.1 mmol) and C (45 mg, 50 μmol, 5 mol%) were suspended in 1 mL dry toluene. Propanal (72 μL, 1.0 mmol) and 81 μL pyridine (1.0 mmol) were added via Eppendorf pipette. The reaction mixture was cooled to 0 °C and 1.05 equiv. of t-butyl hypochlorite (1.05 mmol) was then added with an Eppendorf pipette and allowed to stir 1 h at 0 °C. After completion of the oxidation of aldehyde to the mixed anhydride the reaction was diluted with 200 mL dry toluene and cooled to 0 °C. Trans-cyclohexane-1,2-diol (116 mg, 1.0 mmol) were added in one portion followed by DiPEA (680 μL, 4.0 mmol). The reaction mixture was quenched with 10 mL methanol and then filtered using 30 g silica gel suspended with EtOAc to remove the catalyst (the silica gel was washed with EtOAc). The solvents were then removed in vacuo and 6b was purified as described in chapter 7. 71 mg (0.41 mmol, 41%) of monoprotected diol 6b and 50 mg (0.43 mmol, 43%) of diol 2b were obtained. The products were then directly characterized by chiral GC analysis and NMR.
