Materials.

HiPco SWNTs (Unidym™ HiPco® Single-Wall Carbon Nanotubes, batch P2771) have been purchased from Unidym™ and used without any further purification.

C₆₀ (BuckyUSA™ BU-602, Lot 06080101) has been purchased from BuckyUSA™ and used without any further purification.

C₇₀ (BuckyUSA™ BU-703, Lot gg01121) has been purchased from BuckyUSA™ and used without any further purification.

(nBu₄N)₄[(NH₂(CH₂)₃Si)₂O(γ-SiW₁₀O₃₆)] and its precursor K₈[γ-SiW₁₀O₃₆] were prepared following literature procedures.

Chemicals and solvents for synthesis and for carbon nanomaterials solubilisation have been purchased from Sigma-Aldrich and used as received.

Equipment.

¹H NMR spectra have been recorded with Bruker AV300 instruments operating at 300.13 MHz; for protonic spectra, the following symbolism has been used: s: singlet; d: doublet; t: triplet; q: quartet; m: multiplet. ¹³C NMR spectra have been recorded with Bruker AV300 operating at 75.4 MHz; Si(CH₃)₄ was used as reference. ¹⁸³W NMR and ²⁹Si NMR spectra have been recorded with a Bruker Avance DRX 400 instrument operating at 16.67 MHz and 79.50 MHz, respectively, using 2M Na₂WO₄ in D₂O and Si(CH₃)₄ in CDCl₃ as external references.

FT-IR (KBr) spectra have been collected on a Thermo Quest Nicolet 5700 instrument. For FT-IR spectra the following symbolism has been used: w: weak signal; s: strong signal; b: broad signal.

ESI-MS spectra have been obtained with an Agilent LC/MSD Trap SL spectrometer, using a capillary potential of 1500V.

UV-Vis-NIR experiments have been performed at room temperature on a Varian Cary 5000 UV-Vis-NIR double beam spectrophotometer; 10 mm path length Hellma Analytics 100 QS quartz cuvettes have been used. Fluorescence UV-Vis spectra have been recorded on a Varian Cary Eclipse Fluorescence Spectrophotometer; 10 mm path length Hellma Analytics 117.100F QS quartz cuvettes have been used.
Zeta-potential was obtained by using a Malvern Zetasizer Nano ZS90 instrument, in polymethyl methacrylate (PMMA) cuvettes containing 1 ml of the solution under investigation.

Raman spectra were acquired with a Renishaw instrument, model Invia reflex equipped with 532, 633, and 785 nm lasers.

Thermogravimetric analyses have been performed on a TGA Q500 (TA Instruments) and recorded under N$_2$, upon equilibration at 100 °C, followed by a ramp of 10 °C/min up to 1000 °C. An appropriate quantity of material for performing TGA analysis has been collected only for 1@HiPco.

Transmission electron microscopy (TEM) experiments have been performed using a Philips EM 208, accelerating voltage of 100 kV. Samples were prepared by sonication for 10 min and dropwise addition (8 µL) of the sample onto a carbon coated 200 mesh Ni grid (EM Sciences, Gibbstown, NJ) followed by solvent evaporation under vacuum.

For the AFM analysis, 100µl of each sample with a concentration of 2 µg/ml were spin coated (4000 rpm, 6 min) over Si wafer, gently rinsed with water and acetone, and blown with dry nitrogen, finally the samples were dry under vacuum in order to remove the excess of solvents. The samples have been characterized using a Nanoscope V (Digital Instruments Metrology Group, model MMAFMLN) in tapping mode in air at room temperature, using standard µmash® SPM probe (NSC15/AIBS) with tip height 20-25µm, cone angle <40° (Resonant frequency 325kHz, force constant of ~46N/m). Image analysis was performed with WsXM software (Nanotec Electronica S. L.).

**Methods.**

**Synthesis of (nBu$_4$N)$_4$[\{(C$_{16}$H$_9$SO$_2$NH(CH$_2$)$_3$Si)$_2$O(γ-SiW$_{10}$O$_{36}$)\}] (1)**

\[ \text{(nBu}_4\text{N)}_4[\{(\text{C}_{16}\text{H}_9\text{SO}_2\text{NH(CH}_2)_3\text{Si})_2\text{O(γ-SiW}_{10}\text{O}_{36})\}] \]

\[ \text{(nBu}_4\text{N)}_4[\{(\text{C}_{16}\text{H}_9\text{SO}_2\text{NH(CH}_2)_3\text{Si})_2\text{O(γ-SiW}_{10}\text{O}_{36})\}] \]

\[ \text{NEt}_3, \text{CH}_3\text{CN} \]

\[ 50° \text{C, 3h} \]

*Scheme S1*
In a round bottomed flask, \((nBu_4N)_4[(NH_2(CH_2)_2)Si]_2O(\gamma-SiW_{10}O_{30})]^{4-}\) (450 mg, 0.14 mmol) was suspended in CH\(_3CN\) (3 mL). After stirring for 5 min, triethylamine (49 µl, 0.35 mmol) was slowly added under vigorous stirring. 1-Pyrensulfonyl chloride (105 mg, 0.35 mmol) was dissolved in CH\(_3CN\) (6 ml) and added dropwise in solution whilst stirring. The mixture was heated at 50°C for 3 h and then centrifuged to remove insoluble reagents and byproducts. The volume of the solution was reduced to 1 mL, upon evaporation under vacuum, than diethyl ether was added to precipitate the product. The solid was finally washed with water (2x5 mL), diethyl ether (2x5 mL), and a small amount of CH\(_2\)Cl\(_2\) (2x5 mL) on a fritted funnel, and dried several hours under vacuum. 410 mg (0.1 mmol) of product were obtained (71% yield).

Elemental analysis: Calcd. for C\(_{102}H_{786}N_{60}O_{41}S_2Si_3W_{10}\) C 29.67 H 4.30; N 2.04; S 1.55; Found: C 28.87; H 4.07; N 1.94; S 1.03. FT-IR (KBr): \(v = 2961\) (m), 2923 (m), 2873 (m), 1483 (m, b), 1385 (m), 1318 (w, b), 1159 (w), 1143 (w), 1132 (w), 1100 (m), 949 (m), 902 (s), 885 (s), 839 (s), 819 (s), 742 (s, b), 650 (w) cm\(^{-1}\). \(^1\)H NMR (300 MHz, CD\(_3\)CN, 301 K) \(\delta = 0.57\) (4H, m, NCH\(_2CH_2CH_2Si\)), 0.94 (48H, t, N(CH\(_2\)CH\(_2\)CH\(_2\)CN)), 1.27 (4H, m, NCH\(_2CH_2CH_2Si\)), 1.34 (32H, m, N(CH\(_2\)CH\(_2\)CH\(_2\)CN)), 1.59 (32H, m, N(CH\(_2\)CH\(_2\)CH\(_2\)CN)), 3.09 (32H, m, N(CH\(_2\)CH\(_2\)CH\(_2\)CN)), 3.54 (4H, m, NCH\(_2CH_2CH_2Si\)), 6.14 (2H, t, \(^3\)J = 5.6 Hz, NHCH\(_2CH_2CH_2Si\)) 8.86 - 8.02 (18 H, m, Ar-H), ppm. \(^{13}\)C\(^{[1]}\)H\)NMR (75.47 MHz, CD\(_3\)CN, 301 K): \(\delta = 12.35\) (2C, SiCH\(_2CH_2CH_2N\)), 13.86 (16C, N(CH\(_2\)CH\(_2\)CH\(_2\)CN)), 20.29 (16C, N(CH\(_2\)CH\(_2\)CH\(_2\)CN)), 22.99 (2C, SiCH\(_2CH_2CH_2N\)), 24.32 (16C, N(CH\(_2\)CH\(_2\)CH\(_2\)CN)), 46.50 (2C, SiCH\(_2CH_2CH_2N\)), 59.24 (16C, N(CH\(_2\)CH\(_2\)CH\(_2\)CN)), 135.25-124.42 (32 C, Ar-C) ppm. \(^{29}\)Si NMR (79.5 MHz, CD\(_3\)CN/d-DMSO, 25°C): \(\delta = -62.61\) (2 Si), -88.34 (1 Si) ppm. \(^{183}\)W NMR (16.7 MHz, CD\(_3\)CN, 25°C): -107.51 (4 W), -136.03 (2W), -141.52 (4 W) ppm. ESI-MS (\(-\), CH\(_3\)CN): \(m/z = 789.5, 1053.1\) expected for [C\(_{38}H_{32}N_2O_{41}S_2Si_3W_{10}\)]\(^{4+}\) = 789.9; [C\(_{38}H_{33}N_2O_{41}S_2Si_3W_{10}\)]\(^{5+}\) = 1053.5. \(\zeta\)-potential (1 mg in 1.5 mL of CH\(_3\)OH:DMF=1:1) = -38.2 mV.

**Spectroscopic analyses of mixtures containing fullerenes and 1.**

A precise quantity of 1 (3 mg) was dispersed in 10 ml DMF and the solution was diluted six times (solution A). At the same time, a precise amount of fullerene (7.2 mg for C\(_{60}\), 8.4 mg for C\(_{70}\)) was dissolved in 2 ml o-DCB and the solution was diluted six times (solution B). Dilutions have been performed in order to maintain a reasonable value of absorbance during the titrations. Absorption and emission titrations were performed upon stepwise addition of 4 µl of solution B (5x10\(^{-3}\) M) into 2.7 mL of solution A (10 µM).

Concerning fluorescence experiments, excitation wavelength was generally set at 338 nm. For Stern-Volmer calculations, however, excitation wavelength was set at 350 nm, in order to minimize the absorption by fullerenes. Measurements were also corrected for the inner filter effect. At the emission position corresponding to half cell length (1/2 L), the absorption (optical density, OD) of the excitation light by the fullerenes at concentration C can be calculated by the following equations:
\[ OD = \log \frac{I_0}{I} = \frac{1}{2} \varepsilon_{350} CL \]

\[ F = F_1 \frac{I_0}{I} \]

where \( I_0/I \) is the ratio between the intensities of incident and transmitted excitation light, \( \varepsilon_{350} \) is the molar absorption coefficient constant of the fullerenes, \( F_1 \) is the original fluorescence intensity measured from the spectra and \( F \) is the corrected fluorescence intensity after deduction of the inner filter effect.

**Job plot experiments**

For the Job plot experiments, stock solutions of 1 (10.0 µM) in DMF (solution A) and fullerenes (\( C_{60} \) or \( C_{70} \)) (10\(^{-3}\) M) in \( \alpha \)-DCB (solution B) were prepared. 11 solutions were prepared upon dilution, in DMF, of different quantities of A and B (solution 1: 20 µl A and 0 µl B; solution 2: 18 µl A and 2 µl B; solution 3: 16 µl A and 4 µl B; solution 4: 14 µl A and 6 µl B; solution 5: 12 µl A and 8 µl B; solution 6: 10 µl A and 10 µl B; solution 7: 8 µl A and 12 µl B; solution 8: 6 µl A and 14 µl B; solution 9: 4 µl A and 16 µl B; solution 10: 2 µl A and 18 µl B; solution 11: 0 µl A and 2 µl B). The total volume was fixed at 2.0 mL. The fluorescence intensity at 397 nm was then recorded (\( \lambda_{ex} = 338 \) nm).

**Procedure followed for carbon nanotubes dispersion in the presence of 1.**

A precise quantity of 1 (3 mg) was dissolved in 3 ml DMF/MeOH 1:1 solution; after stirring the solution for 5 minutes, a precise quantity of CNTs (3 mg) was added. The mixture was treated with sonic bath irradiation for 30 minutes, and then stirred for further 30 minutes. The mixture was centrifuged for 1h at 3000 rpm, and the supernatant solution was collected. UV-Vis-NIR absorption and emission experiments were performed directly on the supernatant solutions without any dilution. Concerning fluorescence experiments, excitation wavelength was set at 335 nm. Recorded zeta-potential value was -12.9 mV.
Spectra
