\textbf{Ag,AgBr@SiO\textsubscript{2}@RF polymer:} In a typical synthesis, CTAB (0.10 g) was dissolved in a mixture of water (20 mL) and ethanol (8 mL). Then, an aqueous solution of ammonia (NH\textsubscript{4}OH, 0.1 mL, 25 wt\%) was added and stirred at 30 °C for 15 min, followed by addition of an aqueous solution of silver nitrate (1.0 mL, 0.15 M). After stirring for 15 min, TEOS (2 mL) was added. After stirring for an additional 30 min, a solution of formaldehyde (0.28 mL) was added. After further stirring for 1 h, resorcinol (0.2 g) was added. The mixture was stirred for 24 h at 30 °C and subsequently heated for 24 h at 100 °C under static conditions in a Teflon-lined autoclave. The solid product was recovered by centrifugation and vacuum dried at 100 °C for 24 h.

\textbf{Ag@Carbon yolk-shell:} Ag,AgBr@SiO\textsubscript{2}@RF polymer was carbonized under N\textsubscript{2} atmosphere at 600 °C for 1 h with a heating rate of 1 °C/min using MTI OTF-1200X tube furnace. After washing in 5wt % HF aqueous solution for 24 h, Ag@Carbon yolk-shell was obtained.

\textbf{Characterization:} Scanning electron microscopy (SEM) images, scanning TEM (STEM) images and energy dispersive x-ray analysis (EDS) mapping were obtained on a FEI Quanta 200 FEG Environmental-SEM equipped with an EVEX EDS. Transmission electron microscopy (TEM) images and selected area electron diffraction (SAED) patterns were recorded using a Philips CM200 FEG-TEM. X-ray diffraction (XRD) patterns were recorded on a Bruker D8 Discover Diffractometer operated in grazing incidence diffraction mode. N\textsubscript{2} sorption analysis was performed on a Micromeritics ASAP2010 volumetric adsorption analyzer at 77 K. The surface area and pore size were obtained by using Brunauer–Emmett–Teller (BET) and Barrett–Joyner–Halenda (BJH) methods, respectively. The Raman spectra were taken by Horiba LabRAM Aramis Raman spectrometer with excitation wavelength at 532 nm.
