General information

All chemicals were used as received unless otherwise noted. Reagent grade solvents (MeCN, CH\textsubscript{2}Cl\textsubscript{2}, hexane, toluene) were distilled prior to use. All reported NMR spectra were recorded on 500 MHz spectrometer unless otherwise noted. Chemical shifts (\( \delta \) ppm) were determined with TMS as the internal reference; \( J \) values are given in Hz. UV-vis absorption spectra were recorded in THF. Chromatography was performed on silica (Kieselgel 60, 200-400 mesh) and dry column vacuum chromatography (DCVC) was performed on preparative thin layer chromatography silica (Merck 107747). Mass spectra were obtained via EI or electrospray MS. Electronic absorption spectra were collected on a UV-VIS absorption spectrometer Lambda 35 (Perkin Elmer, Rodgau, Germany). The spectra were corrected with solvent absorption spectra. Steady-state fluorescence emission spectra were collected on an FLS920-stm spectrometer (Edinburgh Instruments, Livingstone, United Kingdom). The spectra were corrected for the detector response. Fluorescence decays were also acquired on the FLS920-stm spectrometer using Time Correlated Single Photon Counting (TCSPC) technique with a sub-nanosecond pulsed LED (EPLED 320) as an excitation source. Fluorescence decay times were determined from the decays using the least squares fitting method. The fitting was assumed to be correct when the goodness-of-fit value \( \chi^2 \) was lower than 1.2. Fluorescence quantum yields were measured on a C9920-02G absolute QY measurement system from Hamamatsu (Hamamatsu Photonics Deutschland GmbH, Herrsching am Ammersee, Germany). All measurements were executed using 3ml quartz cuvette (Hellma GmbH, Jena, Germany) with 1 cm light path. All measurements were executed for samples with OD below 0.15.
Typical procedure.
To a mixture of di-O-benzoyl-1,5-dihydroxyantraquinone (480mg, 1 mmol) and K$_2$CO$_3$ (1.38g, 10 mmol) in 10 ml of DMSO, 6 mmol of derivative of phenylacetic acid methyl ester was added under an argon atmosphere and the resulting suspension was stirred at 100 °C for 1 hour. Acetic acid (0.6 mL), followed by 300 ml of water were added and the resulting suspension was cooled down. The precipitate was filtered off and washed with ethanol. Recrystallization from CHCl$_3$/EtOH gave pure biscoumarin.
