**Polymerase stop assay protocol**

Samples containing DNA template (200 ng), 5'-TAMRA primer (500 nM), dNTPs (200 uM) and 2U of DreamTaq polymerase were made up on ice and mixed via gentle pipetting. After an initial 3 minute denaturation at 95 °C, cycles of denaturation (95 °C, 30s), annealing (52 °C, 30s) and extension (72 °C, 30s) were performed. Aliquots were taken after each extension step and quenched with EDTA. Samples were run as per supplier’s instructions on a 15 % TBE-Urea polyacrylamide gel and the TAMRA visualized on a Typhoon imager, before Sybr Gold post-staining and subsequent visualization.

(2) Ethyl 3-((1,3-dioxolan-2-yl)methoxy)benzoate (Reported WO 2004/018493)

2-bromomethyl-1,3-dioxolane (4 mL, 38.63 mmol) ethyl-3-hydroxybenzoate (1.66 g, 10.00 mmol), potassium carbonate (2.76 g, 20.00 mmol) and potassium iodide (0.83 g, 5.00 mmol) were heated at 120 °C in 10 mL of DMF for 18 hours. The reaction was cooled to room temperature and concentrated under reduced pressure. The residue was partitioned between DCM (150 ml) and water (150 mL). The organic layer was separated and the aqueous layer extracted with DCM (2 x 80 mL). The organic extracts were combined, washed with brine (50 mL), dried (MgSO₄) and concentrated under reduced pressure. The residue was purified by column chromatography, eluting with 20 % hexane in DCM. The product was obtained as a colourless oil (2.238 g, 8.90 mmol, 89 %).
