1.0 Experimental Procedures

General procedure

NMR spectra were recorded using either a Bruker AMX400 or an Avance DFX400 instrument. Deuterated chloroform (CDCl₃) and Deuterated DMSO (dimethyl sulfoxide-d₆) were used as solvents. Chemical shifts (δ values) were reported in parts per million (ppm) with the abbreviations s, d, t, q, qn, sx, dd, ddd and br denoting singlet, doublet, triplet, quartet, quintet, sextet, double doublets, doublet of doublets of doublets and broad resonances respectively. Coupling constants (J) are quoted in Hertz.

IR spectra were recorded as Nujol® mulls (N) on a Perkin Elmer RX1 FT-IR instrument.

All the melting points were determined on a Gallenkamp melting point apparatus.

Mass spectra (m/z) were recorded under conditions of electrospray ionisation (ESI). The ions observed were quasimolecular ions created by the addition of a hydrogen ion denoted as [MH]+. The instrument used was Xcalibur Tune 2.1 (SP1).

The size and morphology of the MNPs at various stages of functionalization were observed by Philips/FEI CM20 transmission electron microscopy and samples were obtained by placing a drop of colloid solution onto a copper grid and allowing evaporation in air at room temperature.

Thermo-gravimetric (TGA) analyses were performed using a TGA-Q50 thermo-gravimetric analyzer.
Iodoalkyl-functionalized silica coated magnetic nanoparticles (3)

Complete precipitation of Fe$_2$O$_3$ was achieved under alkaline conditions, while maintaining a molar ratio of Fe$^{2+}$:Fe$^{3+} = 1:2$ under nitrogen. To obtain 0.7 g of $\gamma$-Fe$_2$O$_3$ MNPs 1, FeCl$_2$.4H$_2$O (0.8 g, 4 mmol) and FeCl$_3$ (1.3 g, 8 mmol) dissolved in degassed deionized water 40 mL were added dropwise into 2M NaOH solution (200 mL) with vigorous stirring. After 1 hour, the resulting $\gamma$-Fe$_2$O$_3$ MNPs 1 were separated by putting the vessel on a neodymium magnet and decaying the supernatant. The MNPs 1 were washed with degassed deionized water (2×100 mL) and 0.01M HCl (17 %, 100 mL) to remove unreacted iron salts. $\gamma$-Fe$_2$O$_3$ MNPs 1 were coated with SiO$_2$ using a sol-gel method. Typically, 0.7 g of $\gamma$-Fe$_2$O$_3$ MNPs 1 were dispersed in a mixed solution of degassed ethanol (400 mL) and degassed deionized water (100 mL) by sonication for 10 min. NH$_4$OH (35 %, 36 mL) and tetraethyl orthosilicate (3.6 mL, 16 mmol) were consecutively added to reaction mixture and the reaction was allowed to proceed at room temperature for 2 h under continuous sonication. 3-iodopropyltrimethoxysilane (6.3 mL, 32 mmol) was then added and the reaction was allowed to proceed for further 3 h. The resultant functionalized particles 3 were obtained by magnetic separation and thoroughly washed with degassed ethanol (2×100mL). Finally the resultant yellow powder (2.3 g) was dried at 120 °C.

5-Bromo-2,9-bis(5,5,8,8-tetramethyl-5,6,7,8-tetrahydrobenzo[e][1,2,4]triazin-3-yl)-1,10-phenanthroline (4)

To a suspension of 5-bromo-1,10-phenanthroline-2,9-dicarbohydrazonamide (1.47 g, 3.9 mmol) in 1,4-dioxane (200 mL) was added 3,3,6,6-tetramethylcyclohexane-1,2-dione (1.72 g, 10.2 mmol, 2.6 eq). Triethylamine (6 mL, 42.7 mmol) was added and the mixture was heated under reflux for 3
days. After allowing the solution to cool to room temperature, the solvent was evaporated and the remaining semi-solid residue was triturated with ice-cold Et₂O (400 mL). The insoluble solid was filtered and washed with further ice-cold Et₂O (400 mL) and allowed to dry in air to afford the 4 as a yellow solid (1.23 g, 49 %); Mp (197-200 °C); ¹H NMR (400.1 MHz, CDCl₃) δ_H (ppm) = 1.54 (s, 12H), 1.56 (s, 12H), 1.90 (s, 8H), 8.29 (s, 1H), 8.39 (d, J = 8.0 Hz, 1H), 8.86 (d, J = 8.4 Hz, 1H), 8.88 (d, J = 8.4 Hz, 1H), 8.95 (d, J = 9.4 Hz, 1H); ¹³C NMR (100.6 MHz, CDCl₃) δ_C (ppm) = 29.3, 29.8, 33.6, 33.8, 36.7, 37.5, 122.0, 124.0, 124.1, 128.9, 129.8, 130.6, 136.3, 137.3, 146.0, 146.9, 154.4, 154.7, 161.1, 161.3, 163.3, 163.4, 165.0, 165.1; C₃₄H₃₇N₈Br [MH]⁺ requires m/z 637.2397 and 639.2377; (FTMS + p ESI) MS found m/z 637.2392 and 639.2371; IR ν_max / cm⁻¹ = 3531, 3486, 2959, 2865, 1644, 1609, 1510, 1475, 1452, 1439.

4-(2,9-Bis(5,5,8,8-tetramethyl-5,6,7,8-tetrahydrobenzo[e][1,2,4]triazin-3-yl)-1,10-phenanthroline-5-yl)phenol (5)

A suspension of 5-bromo-2,9-bis(5,5,8,8-tetramethyl-5,6,7,8-tetrahydrobenzo[e][1,2,4]triazin-3-yl)-1,10-phenanthroline (0.51 g, 0.8 mmol), tetrakis(triphenylphosphane)palladium(0) (0.04 g, 0.04 mmol, 0.05 eq), (4-hydroxyphenyl)boronic acid (0.13 g, 0.9 mmol, 1.1 eq) and K₂CO₃ (0.15 g, 1.1 mmol, 1.4 eq) in degassed EtOH (75 mL) was heated to reflux for 18 h under nitrogen. The solution was allowed to cool to room temperature and filtered and the remaining solid residue was washed with EtOH (20 mL). The filtrate was evaporated and the solid residue was taken up in DCM (150 mL) and water (100 mL) was added. The organic layer was washed with saturated brine (100 mL) and dried over MgSO₄. The filtrate was evaporated and the solid was triturated with Et₂O (100 mL). The insoluble solid was filtered and washed with Et₂O (50 mL) and allowed to dry in air to afford 5 as a yellow solid (0.31 g, 59 %); Mp (250-252 °C); ¹H NMR (400.1 MHz, CDCl₃) δ_H (ppm) = 1.58 (s, 12H), 1.61 (s, 12H), 1.93 (s, 8H), 6.46 (d, J = 8.4 Hz, 2H), 6.63 (d, J = 8.4 Hz,
2H), 7.67 (s, 1H), 8.28 (d, J = 8.4 Hz, 1H), 8.41 (d, J = 8.4 Hz, 1H), 8.76 (d, J = 8.8 Hz, 1H), 8.87 (d, J = 8.0 Hz, 1H); $^{13}$C NMR (100.6 MHz, CDCl$_3$) $\delta$ (ppm) = 29.3, 29.9, 33.8, 36.7, 37.6, 115.6, 122.9, 123.7, 127.0, 128.2, 129.5, 129.5, 130.0, 136.3, 137.3, 140.2, 145.3, 146.5, 153.2, 153.3, 157.7, 161.0, 161.3, 163.5, 163.6, 165.2, 165.3; C$_{40}$H$_{43}$N$_8$O [MH]$^+$ requires $m/z$ 651.3554; (FTMS + p ESI) MS found $m/z$ 651.3553; IR $\nu_{\text{max}}$ / cm$^{-1}$ = 3399, 2962, 2931, 2865, 1611, 1587, 1514, 1471, 1456, 1389, 1365.

**Immobilisation of (5) on silica coated magnetic nanoparticles (6)**

Sodium hydride (60 % dispersion in mineral oil, 0.03 g, 0.9 mmol, 1.3 eq) was added to a solution of 4-(2,9-Bis(5,5,8,8-tetramethyl-5,6,7,8-tetrahydrobenzo[1,2,4]triazin-3-yl)-1,10-phenanthroline-5-yl)phenol 5 (0.46 g, 0.7 mmol) in DMF (100 mL) at 120 °C and stirred for 30 min. Iodoalkyl-functionalized SiO$_2$-coated MNPs 3 (0.72 g) were slowly added and the reaction mixture was stirred at 120 °C overnight. CyMe$_4$-BTPhen-functionalized MNPs 6 were separated by an external magnet and were thoroughly washed with degassed ethanol (3×100mL). Finally, the product (0.24 g) was allowed to dry at 120 °C.

2.0 Extraction Results

General Procedure

The aqueous solutions for the solvent extraction experiments were prepared by spiking nitric acid solutions (0.745 mL) (0.001 – 4 M) with stock solutions of 5 µL of \(^{241}\text{Am} (\approx 400 \text{ Bq/µL})\), 3 µL of \(^{152}\text{Eu} (\approx 1.000 \text{ Bq/µL})\), and 7 µL of \(^{244}\text{Cm} (\approx 300 \text{ Bq/µL})\) and then adding 600 µL of spiked aqueous solution to 18 mg of CyMe\(_4\)-BTPhen-functionalized MNP 6. 150 µL of each labelled solution was taken as a standard (to allow mass balance calculations) for γ- measurements and 10 µL was taken as a standard for α- measurements. The suspension was sonicated for 10 min and shaken on a Heidolph Reax shaker at 1800 rpm for 90 min. After centrifuging for 10 min, aliquots of the aqueous solutions (supernatant) were separated and taken for measurements. Activity measurements of \(^{241}\text{Am}, ^{152}\text{Eu}\) and \(^{244}\text{Cm}\) were performed with a γ-ray spectrometer EG&G Ortec (USA) with a PGT (USA) HPGe detector and α-ray spectrometer Octete plus Ortec (Germany) with ion-implanted-silicon ultra α-detector (USA). The distribution ratios, D, were calculated as the ratio between the radioactivity (α- and γ- emissions) of each isotope in the standard solution and the supernatants after removal of the MNP 6 complexes. The separation factor is \(SF_{\text{Am/Eu}} = \frac{D_{\text{Am}}}{D_{\text{Eu}}}\) or \(SF_{\text{Am/Cm}} = \frac{D_{\text{Am}}}{D_{\text{Cm}}}.\) All extraction experiments were carried out in duplicate and error bars in the figures represent standard deviations.
