Supporting Information
**Experimental details**

**Materials**
All chemical reagents, yttrium(III) acetatehydrate (99.9%), ytterbium(III) acetate tetrahydrate (99.9%), thulium(III) acetate hydrate (99.9%), 1-octadecene (technical grade, 90%), oleic acid (technical grade, 90%), sodium hydroxide (≥ 97%), ammonium fluoride (98%), potassium iodide (99%), potassium hydroxide (90%), silver nitrate (≥ 99%), sodium chloride (99%), succinic anhydride (≥ 99%), hydrogen peroxide solution (30 wt. % in H₂O), N,N′-dicyclohexyl carbodiimide (99%), N,N-Dimethylpyridin-4-amine (≥ 99%), and solvents were purchased from Sigma-Aldrich. The amphiphilic polymer DSPE-PEG(2000) amine, 1,2-distearoyl-sn-glycero-3-phosphoethanolamine-N-[amino(polyethyleneglycol)-2000] (ammonium salt), was purchased from Avanti Polar Lipids, Inc. The precursor of the metal complex potassium tetrachloroplatinate(II) (99%) was purchased from Precious Metals Online PMO Pty Ltd. Nanopure water was obtained using the Barnstead Nanopure Ultrapure Water Purification System.

**Synthesis of core-NaYF₄:Yb³⁺/Tm³⁺**

The core-NaYF₄:Yb³⁺/Tm³⁺ (rare earth element ratio 69.5/30/0.5 mol%) synthesis was carried out following a slightly modified literature procedure (E. Ruggiero et al., *Chem. Commun.* **2014**, *50*, 1715–1718).

In a typical synthesis (total rare earth amount, 3 mmol), yttrium(III) acetate hydrate (555 mg, 2.1 mmol), ytterbium(III) acetate tetrahydrate (380 mg, 0.90 mmol) and thulium(III) acetate hydrate (5.2 mg, 0.015 mmol) were dissolved in 1-octadecene (25 mL) and oleic acid (15 mL) in a 100 mL three-neck round-bottom flask with coil condenser. The suspension was heated up to 120 °C with a slow temperature ramp of 3.2 °C/min under stirring and vacuum. Once reaction mixture reached such temperature, it was kept in these conditions for 30 min in order to form a clear solution and eliminate residual water and oxygen. The system was then allowed to cool to 50 °C under a flow of nitrogen gas.

A solution of sodium hydroxide (300 mg, 7.5 mmol) and ammonium fluoride (444 mg, 12.0 mmol) in methanol (8 mL) was added to the reaction flask drop wise in 10 min. The subsequent cloudy solution was stirred for 30 min at 50°C and for 30 min at 70°C under nitrogen to evaporate the entire amount of methanol from the solution. Successively, the system was heated up to 300°C with a fast temperature ramp of 13.5 °C/min under stirring and nitrogen and maintained in such conditions for 90 min. The reaction mixture progressively changed from turbid to yellow and transparent.

Next, the flask was left cooling to room temperature, and nanoparticles were purified by centrifugation (4500 rpm at 20 °C for 15 min) to remove any excess of reagents and solvents. The white pellet was washed once with of ethanol (40 mL) and once with THF/ethanol (5/35 mL) and recollected by centrifugation. Upconversion nanoparticles were dried at room
temperature overnight. Typically, ca. 600 mg of NaYF₄:Yb³⁺/Tm³⁺ nanoparticles are obtained employing the reaction conditions described.

**Synthesis of core-shell NaYF₄:Yb³⁺/Tm³⁺@NaYF₄**

Synthesis of core-shell NaYF₄:Yb³⁺/Tm³⁺@NaYF₄ nanoparticles was realized by employing a slightly modified version of the procedure published by J-C. Boyer *et al.* (*J. Am. Chem. Soc.* 2010, 132, 15766–15772). The previously-obtained NaYF₄:Yb³⁺/Tm³⁺ nanoparticles were used as seeds to grow a NaYF₄ shell.

In a typical synthesis (total rare earth amount, 0.9 mmol), yttrium (III) acetate hydrate (240 mg, 0.9 mmol) was dissolved in 1-octadecene (15 mL) and oleic acid (6 mL) in a 100 mL three-neck round-bottom flask with coil condenser.

As for core nanoparticles, the suspension was heated up to 120 °C with a slow temperature ramp of 3.2 °C/min under constant stirring and vacuum, and maintained in such conditions for 30 min. Afterwards, the solution was cooled down to 80 °C and placed under a flow of nitrogen gas.

In the same time, a suspension of NaYF₄:Yb³⁺/Tm³⁺ (260 mg) in hexane (10 mL) was prepared via sonication and added to the reaction flask drop by drop (10 min). The resulting turbid solution was heated up to 110 °C (3.2 °C/min) under vacuum to eliminate the hexane. After 30 min the solution was again cooled down to 50 °C and a methanolic (5 mL) solution of sodium hydroxide (88 mg, 2.2 mmol) and ammonium fluoride (130 mg, 3.5 mmol) was added to the system drop wise over 5 min. The flask was maintained for 30 min at 50 °C and for 30 min at 70 °C under nitrogen to evaporate the entire amount of methanol from the reaction mixture. Afterwards, the reaction flask was heated up at 300 °C with a fast temperature ramp of 13.5 °C/min and heating was kept for 90 min. During the nucleation process the solution switches from cloudy to slightly yellow and transparent.

The solution was then cooled down to room temperature, and formation of a white precipitate is observed on the bottom of the flask. The so-obtained core-shell nanoparticles were purified by centrifugation (4500 rpm at 20 °C for 15 min). The pellet was washed with ethanol and THF and dried overnight. Typically, ca. 500 mg of core-shell NaYF₄:Yb³⁺/Tm³⁺@NaYF₄ NPs are obtained.

**Synthesis of cis,cis,trans-[Pt(NH₃)₂(Cl)₂(O₂CCH₂CH₂CO₂H)₂] (1)**

**Synthesis of DSPE-PEG-Pt⁴⁺(2)**

The amphiphilic polymer 1,2-distearoyl-sn-glycero-3-phosphoethanolamine-N-[amino(polyethyleneglycol)-2000] (ammonium salt, DSPE-PEG(2000) amine) was functionalized with 1 using the protocol reported by J. Hernández-Gil, J. C. Mareque-Rivas *et al.* (Submitted).
Briefly, cis,cis,trans-[Pt(NH$_3$)$_2$(Cl)$_2$(O$_2$CCH$_2$CH$_2$CO$_2$H)$_2$] (I) (9.6 mg, 18.0 μmol), dicyclohexyl carbodiimide (3.7 mg, 18.0 μmol) and 4-(dimethylamino)pyridine (1.0 mg, 7.2 μmol) were dissolved in DMSO (130 μL). After 10 minutes, the solution containing the activated Pt$^{IV}$ complex was added to a DMSO solution of DSPE-PEG(2000)-NH$_2$ (10 mg, 3.6 μmol, 170 μL). The resulting mixture was allowed to react at room temperature for 72 h under continuous stirring. Water was then added to the reaction mixture. The solution was centrifuged and the supernatant was passed through a 0.45 μm filter to remove insoluble traces. Then, the supernatant was dialyzed in a Slide-A-Lyzer Dialysis Cassette (Thermo Scientific) (MW cutoff of 2,000) against water (3 x 500 mL). The dialyizate, containing the pure product was lyophilized and the residue dried in vacuo over P$_2$O$_5$ (10.86 mg, 90%). $^1$H NMR (500 MHz, CDCl$_3$) for 2: δ 0.88 (t, CH$_3$, 6H), 1.25 (s, CH$_2$, 56H), 1.61 (m, CH$_2$CH$_2$CO, 4H), 2.32 (m, CH$_2$CH$_2$CO, 4H), 2.60 (m, CH$_2$-succinic, 8H), 3.44 (m, CH$_2$CH$_2$N, 2H), 3.64 (s, PEG ~ 180 H), 3.96 (m, CH$_2$CH$_2$NH, 2H), 4.22 (m, trans-PO$_4$CH$_2$CH, 1H), 4.32 (m, COOCH$_2$COH, 2H), 4.40 (m, cis-PO$_4$CH$_2$CH, 1H), 5.26 (m, PO$_4$CH$_2$CH, 1H), 6.25 (bs, NH$_3$, 6H), 6.68 (bs, NHCOCH$_2$), 6.82 (bs, NHCOOCH$_2$). UPLC/MS $\tau_r$ = 11.38 min; m/z for [C$_{140}$H$_{289}$N$_7$O$_{61}$PPtCl$_2$]$_{3+}$ expected = 1114.28, found = 1114.17 (ESI+).

**Synthesis of NaYF$_4$:Yb$^{3+}$/Tm$^{3+}$@NaYF$_4$@2**

Nanoparticle surface functionalization with DSPE-PEG-Pt$^{IV}$(2) was obtained following previous work by some of us with few adjustments (Gomez Blanco et al., Chem. Commun. 2012, 48, 4211–4213). NaYF$_4$:Yb$^{3+}$/Tm$^{3+}$@NaYF$_4$ nanocrystals (12 mg) and 2 (4 mg) were solubilised in a glass flask containing 6 ml of CHCl$_3$. The solvent was left to evaporate overnight at room temperature under stirring. The flask was placed into an water bath at 80 °C for 30 s, then the nanoparticles were solubilised with 1.5 mL of H$_2$O obtaining a pearly solution. The solution was purified from the excess of polymer by centrifugation (8000 rpm at room temperature for 5 min), and the resulting white nanoparticle pellet was resuspended with 1.5 mL of H$_2$O. Later, the product was freeze-dried overnight and 8 mg of NaYF$_4$:Yb$^{3+}$/Tm$^{3+}$@NaYF$_4$@2 NPs were collected.

**Synthesis of NaYF$_4$:Yb$^{3+}$/Tm$^{3+}$@NaYF$_4$@DSPE-PEG(2000)-NH$_2$**

The same method illustrated above was used to prepare NaYF$_4$:Yb$^{3+}$/Tm$^{3+}$@NaYF$_4$@DSPE-PEG(2000)-NH$_2$ nanomaterials.
**Instrumentation**

**Transmission Electron Microscopy (TEM)**

TEM was performed on a JEOL JEM-1400 PLUS-HC microscope operating at 120 kV. The TEM samples were prepared by dropping 2 µL sample solutions (0.1-1 mg/mL in THF or in water) onto a 400-mesh carbon coated copper grid (3 mm in diameter) followed by the evaporation of the solvent under vacuum. The nanoparticle sizes were estimated from over 150 nanoparticles.

**Fourier Transform Infrared (FTIR)**

FTIR spectra of oleic acid, NaYF₄:Yb³⁺/Tm³⁺, NaYF₄:Yb³⁺/Tm³⁺@NaYF₄, NaYF₄:Yb³⁺/Tm³⁺@NaYF₄@2 and 2 were recorded on a Nicolet FTIR 6700 spectrometer as KBr pellet.

**X-Ray Photoelectron Spectroscopy (XPS)**

XPS experiments were performed in a SPECS Sage HR 100 spectrometer with a non-monochromatic X-ray source Magnesium Kα line of 1253.6eV energy and a power applied of 250 W and calibrated using the 3d₅/₂ line of Ag with a full width at half maximum (FWHM) of 1.1 eV. All measurements were made in an ultra high vacuum (UHV) chamber at a pressure below 8·10⁻⁸ mbar. Samples were measured on titanium surfaces.

**Nuclear Magnetic Resonance (NMR)**

¹H NMR and ¹H-¹H COSY 2D NMR spectra of the various samples were recorded in PBS/D₂O buffer solution (10 mM, pH = 7.3) on an AVANCE III Bruker 500 NMR spectrometer. Chemical shifts were reported in parts-per-million (δ, ppm) and referenced to the residual solvent peak.

**UV–Vis absorption spectroscopy (UV-vis)**

UV-visible-NIR absorption spectra of 1 and NaYF₄:Yb³⁺/Tm³⁺@NaYF₄@2 were acquired in aqueous solution using a Varian Cary 5000 spectrophotometer.

**Dynamic Light Scattering**

The hydrodynamic radius of NaYF₄:Yb³⁺/Tm³⁺@NaYF₄@2 was obtained measuring an aqueous solution containing the nanoparticles (0.5 mg/mL) with 173⁰ scattering angle at 25 ºC using a NanoSizer Malvern Nano-Zs.

**Emission spectroscopy**

Upconverted emission spectra of NaYF₄:Yb³⁺/Tm³⁺, NaYF₄:Yb³⁺/Tm³⁺@NaYF₄, NaYF₄:Yb³⁺/Tm³⁺@NaYF₄@DSPE-PEG(2000)-NH₂ and NaYF₄:Yb³⁺/Tm³⁺@NaYF₄@2 were
collected in THF or aqueous solution on a Fluorometer Fluorolog-TSPC (Horiba-Jovine Ivone) coupled with a 980 nm laser diode (CNI, MDL-N-980).

**Photolysis experiments**

Inside a 1 mL glass vial PBS/D$_2$O buffer solutions (10 mM, pH = 7.3) of 1 and 2 were irradiated with UVA ($\lambda_{exc} = 385$ nm) and NIR light ($\lambda_{exc} = 980$ nm) in the presence or absence of UCNPs. A Prizmatix LED Multi-Wavelength MWLLS-11 and a BWT diode laser DS3-11312-110 were employed for UVA and NIR irradiation experiments respectively. At 385 nm, solutions of 1 (150 µM) and 2 (150 µM) were irradiated with a power density of 40 mW cm$^{-2}$ and formation of photoproducts was monitored by $^1$H NMR. In the case of UCNP-mediated photolysis, a power density of 4.9 and 7.3 W cm$^{-2}$ was employed for 980-nm excitation of 1 (150 µM) with NaYF$_4$:Yb$^{3+}$/Tm$^{3+}@$NaYF$_4$ (5 mg), and for NaYF$_4$:Yb$^{3+}$/Tm$^{3+}@$NaYF$_4@$2 (5 mg) respectively. After irradiation, the nanoparticle solutions were centrifuged (5000 rpm, 5 min) and the supernatants were analysed by $^1$H NMR. After each measurement, supernatants were combined again with the pellet, obtaining the initial solution used in the photoreaction. Such procedure was employed to improve the quality of NMR spectra. Control experiments consisted of exciting directly (no UCNPs) at 980 nm 1 (150 µM) and 2 (150 µM) in buffer using a power density of 6.5 and 8.8 W cm$^{-2}$ respectively.
Results

Figure S1 Size distribution histograms of (A) NaYF₄:Yb³⁺/Tm³⁺ and (B) NaYF₄:Yb³⁺/Tm³⁺@NaYF₄ nanoparticles. Average diameter of NaYF₄:Yb³⁺/Tm³⁺ is 30 ± 2 nm. Average diameter of NaYF₄:Yb³⁺/Tm³⁺@NaYF₄ is 37 ± 3 nm.
Figure S2 FT-IR spectra of (black) pure oleic acid, (light blue) NaYF₄:Yb³⁺/Tm³⁺, (blue) NaYF₄:Yb³⁺/Tm³⁺@NaYF₄, (green) NaYF₄:Yb³⁺/Tm³⁺@NaYF₄@2, (red) 2.
Figure S3 XPS spectra of (black) NaYF$_4$:Yb$^{3+}$/Tm$^{3+}$ and (red) NaYF$_4$:Yb$^{3+}$/Tm$^{3+}$@NaYF$_4$ nanoparticles confirming the presence of C, O, F, Na, Y, Tm and Yb as assigned by core level and Auger electrons.
**Figure S4** Upconversion luminescence spectrum of NaYF$_4$:Yb$^{3+}$/Tm$^{3+}$ (0.5 mg·mL$^{-1}$ in THF) upon 980 nm excitation.
Figure S5 Upconversion luminescence spectra of (top) NaYF₄:Yb³⁺/Tm³⁺@NaYF₄ (0.5 mg·mL⁻¹ in THF) and (bottom) its magnification upon 980 nm excitation at different powers (3.4–20.6 W cm⁻²).
