1. General Experimental Details

Reagents were purchased from Sigma-Aldrich, Alfa Aesar, Acros Organics or Fluorochem and used as received unless otherwise noted. Dry dichloromethane was obtained dry from a Pure Solv MD-7 solvent machine and stored under nitrogen. Dry DMF was purchased from Acros Organics (<50 ppm water) and degassed by nitrogen bubbling and sonication prior to use. Petrol refers to the fraction of petroleum ether boiling in the range 40–60 °C.

Compounds 3c, 3d, Z-4e and E-4e were synthesised as described in the literature. Compound 3e was synthesised from 4-cyanobenzaldehyde by reduction followed by chlorination using a modified literature procedure.

$^1$H NMR and $^{13}$C NMR spectra were recorded on a Jeol ECX400 or Jeol ECS400 spectrometer operating at 400 and 100 MHz respectively, or on a Bruker AV500 operating at 500 and 125 MHz respectively. $^{31}$P NMR spectra were recorded on a Jeol ECX400 spectrometer at 162 MHz. TLC analysis was carried out using Merck 5554 aluminium backed silica plates. Preparatory TLC was carried out using Analtech UNIPLATE glass-backed silica plates. Flash column chromatography was performed using SiO$_2$/K$_2$CO$_3$ (9:1, w/w) as the stationary phase with the solvent systems specified within the text. Electrospray ionisation (ESI) mass spectrometry was performed on a Bruker daltronics micrOTOF spectrometer; electron impact (EI), atmospheric pressure chemical ionisation (APCI) and liquid induction field desorption ionisation (LIFDI) were performed on a Waters GCT Premier mass spectrometer. Less than 5 ppm error was recorded for all HRMS samples. Infrared (IR) spectroscopy was performed on a PerkinElmer Spectrum Two spectrometer using an UATR attachment. Melting point analyses were performed on a Stuart SMP3 melting point apparatus, using a temperature ramp of 3 °C/minute. UV–visible spectroscopy was performed on a Jasco V-560 spectrometer, with a background taken in the appropriate solvent prior to recording spectra. Elemental analysis was carried out using an Exeter Analytical CE-440 Elemental Analyser.

2. General Procedures

General procedure 1: synthesis of complexes 1 and 2:

An oven-dried Schlenk tube (under N$_2$) was charged with a stirrer bar, the appropriate ligand (0.388 mmol), Pd$_2$dba$_3$•CHCl$_3$ (0.097 mmol) and dry CH$_2$Cl$_2$ (6 mL). The resulting solution was stirred for 10 min, before a solution of N-bromosuccinimide (0.193 mmol) in CH$_2$Cl$_2$ (3 mL) was added. After another 10 min the reaction mixture was poured into petroleum ether (20 mL), and additional petroleum ether (200 mL) was added. No special precautions for the exclusion of air were made during the reaction workup. The resulting precipitate was collected by filtration and dried in vacuo.
General procedure 2: Stille cross-coupling reactions

To a solution of the appropriate catalyst (5.84 μmol, 0.05 eq.) and benzyl halide (0.117 mmol, 1 eq.) in dry DMF (1.5 mL) under N\textsubscript{2} in a Schlenk tube was added the appropriate stannane (0.176 mmol, 1.5 eq.). The reaction vessel was sealed and stirred at room temperature for the required time. After this time the solution was diluted with diethyl ether (20 mL), washed with water (3 × 10 mL), dried (MgSO\textsubscript{4}) and evaporated. No special precautions for the exclusion of air were made during the reaction workup. When purification was performed, it was done using flash column chromatography with a SiO\textsubscript{2}/K\textsubscript{2}CO\textsubscript{3} (9:1, w/w) stationary phase.
