Fig. S1 A: The Raman mapping for the peak of 614 cm⁻¹ of R6G on the 3D orderly turreted silver nanoplates array substrate over an area of 40μm ×40μm. (The Raman spectrometer: Renishaw inVia Reflex, the wavelength 532nm excitation light source, power: 1mW, integral time: 1 s).
Figure S2 Raman spectra for different samples (Integral time: 1s). (a): regular Raman signal of $10^{-2}$ M R6G solution. (b): Raman signal of 100μl of $10^{-4}$M R6G solution dropped on the silver nanoplate built hierarchical turreted ordered array with the projective area 1 cm$^2$.
