General Methods

All reactions were performed under an atmosphere of argon unless otherwise indicated. All reagents and solvents were purchased at the highest commercial quality and used without further purification unless otherwise noted. Dry solvents were obtained using a double column SolvTech purification system. Yields refer to purified spectroscopically (1H NMR) homogeneous materials. Thin Layer Chromatographies were performed with TLC silica on aluminium foils (Silica Gel/UV254, Aldrich). In most cases, irradiation using a Bioblock VL-4C UV-Lamp (6 W, 254 nm and/or 365 nm) as well as p-anisaldehyde, phosphomolybdic acid and Cerium ammonium molybdate stainings were used for visualization. Ultra Performance Liquid Chromatographies coupled to Mass Spectroscopy (UPLC-MS) were carried out on a Waters Acquity UPLC-SQD apparatus equipped with a PDA detector (190-500 nm, 80Hz), using a reverse phase column (Waters, BEH C18 1.7 µm, 2.1mm x 50 mm), and the MassLynx 4.1 – XP software. Preparative Adsorption Flash Column Chromatographies were performed using silica gel (60 Å, 230–400 mesh, 40–63 µm, Sigma-Aldrich). 1H NMR spectra were recorded on a Bruker Avance 400 spectrometer at 400 MHz and 13C spectra at 100 MHz in CDCl3 or CD3CN at 25°C. The spectra were internally referenced to the residual proton solvent signal (CDCl3: 7.26 ppm, CD3CN: 1.94 ppm for 1H spectrum, and CDCl3: 77.16 ppm and CD3CN: 118.26 and 1.32 ppm for 13C spectrum). For 1H NMR assignments, the chemical shifts are given in ppm. Coupling constants J are listed in Hz. The following notation is used for the 1H NMR spectral splitting patterns: singlet (s), doublet (d), triplet (t), multiplet (m), large (l).
To a stirred, sticky suspension of 4-(benzyloxy)-N-(4-(benzyloxy)phenyl)-N-(4-nitrophenyl)aniline\(^1\) (188 mg, 398 µmol, 1.00 eq) in MeOH (5 mL) a 1 M HCl solution (6 mL) was added slowly, followed by two drops of conc. HCl. The mixture was then cooled down to 0°C. After 15 min at this temperature, NaNO\(_2\) (129 mg, 1.87 mmol, 4.70 eq) in water (0.8 mL) was added dropwise within about 2 min. The yellow-orange suspension immediately turned brown after the first drop. The mixture was further stirred for 35 min. NaN\(_3\) (259 mg, 3.98 mmol, 10.0 eq) was added in two equal portions dissolved in water (1.3 mL each). The brown suspension was further stirred for 40 min, while allowing the mixture to heat up to room temperature. Dichloromethane (90 mL) was added and the mixture was washed with water (90 mL). The organic phase was washed with sat. NaHCO\(_3\) (25 mL) followed by brine (25 mL), dried over Na\(_2\)SO\(_4\) and concentrated under reduced pressure. The oily brown crude product was purified by flash column chromatography (SiO\(_2\), dichloro-methane/cyclohexane: 1/1; R\(_f\) (dichloromethane/cyclohexane: 1/1) = 0.27) to afford compound \(1\) (131 mg, 263 µmol, 66 % over two steps) as a brown waxy solid. \(^1\)H NMR (CDCl\(_3\), 400 MHz, 25°C): \(\delta = 7.50–7.33\) (m, 10H, \(H_C\)), 7.04 (d, \(^3\)\(J = 9.2\) Hz, 4H, \(H_B\)), 6.98 (d, \(^3\)\(J = 8.8\) Hz, 2H, \(H_A\)), 6.92 (d, \(^3\)\(J = 8.8\) Hz, 4H, \(H_B\)), 5.06 (s, 4H, \(H_B\)), 6.86 (d, \(^3\)\(J = 8.8\) Hz, 2H, \(H_A\)), 5.06 (s, 4H, \(H_B\)). \(^{13}\)C NMR (CDCl\(_3\), 100 MHz, 25°C): \(\delta = 155.1, 146.1, 141.3, 137.2, 132.3, 128.7, 128.1, 127.6, 126.1, 122.9, 119.8, 115.8, 70.5\); ESI-MS: \(m/z\) calcd for \(C_{32}H_{26}N_{4}O_{2}\): 470.19 [M–N\(_2\)]\(^+\), 498.21 [M]\(^+\), found 470.34, 498.35.

N-(4-(bis(4-(benzyl oxy)phenyl)amino)phenyl)-2-chloroacetamide¹ (300 mg, 546 µmol, 1.00 eq) and NaN₃ (710 mg, 10.9 mmol, 20.0 eq) were suspended in dry DMF (4.80 mL) under an argon atmosphere. The yellow-brown mixture was vigorously stirred at room temperature overnight. After this time, the resulting creamy-white suspension was poured into brine (20 mL) and extracted with EtOAc (115 mL). The organic phase was washed with brine (2 × 75 mL). The aqueous phases were extracted with EtOAc (75 mL). The combined organic phases were dried over Na₂SO₄ and then evaporated to give a brown oil. Figure S5. $^1$H NMR (400 MHz, CD$_3$CN, 25°C) spectrum of 8.

Figure S6. $^1$H NMR (400 MHz, CD$_3$CN, 25°C) spectra of (A) compound 7 irradiated for 1h (20W power lamp) and further treated with NaOD and (B) compound 7 irradiated for 1h (20W power lamp). Red dots (●) indicate NMR peaks corresponding to the triarylamine core.
Figure S7. $^1$H NMR (400 MHz, CD$_3$CN, 25°C) (A) and JMOD $^{13}$C NMR (100 MHz, CD$_3$CN, 25°C) (B) spectra of 9.
Figure S8. $^1$H NMR (400 MHz, CDCl$_3$, 25°C) (A) and JMOD $^{13}$C NMR (100 MHz, CDCl$_3$, 25°C) (B) spectra of 5$^{\text{deprot.}}$. 
Figure S9. Direct comparison of the $^1$H NMR spectra (CDCl$_3$, 400 MHz, 25°C) of a solution (c = 6.9 mM) of non-irradiated compound 5 in chloroform before (A) and after (B) light irradiation (20 W power lamp) for 20 min.

Figure S10. Direct comparison of the $^1$H NMR spectra (CDCl$_3$, 400 MHz, 25°C) of a solution of compound 5$_{deprot}$ (A) and compound 5 (B). Upon deprotonation, protons T1, $\alpha$, am and A1 are downfield shifted, thus indicating that the amide might act as a station for the macrocycle.
3. Optical Spectroscopies

UV-Vis spectra were recorded using a Varian Cary 5000 apparatus with quartz glass cuvettes of 1 cm optical path under ambient conditions, unless otherwise stated.

**Figure S11.** UV-Vis-NIR spectra obtained as a function of time of irradiation for an initial 0.1 mM solution of compounds 4-9 in chloroform.
