1. General Information

All reactions were carried out under a nitrogen atmosphere unless otherwise noted. Solvents were purified by standard techniques without special instructions. $^1$H and $^{13}$C NMR spectra were recorded on either a Varian Inova-400 spectrometer (400 MHz for $^1$H, 100 MHz for $^{13}$C) or a Bruker Avance II-400 spectrometer (400 MHz for $^1$H, 100 MHz for $^{13}$C); CDCl$_3$ and TMS were used as a solvent and an internal standard, respectively. The chemical shifts are reported in ppm downfield (δ) from TMS, the coupling constants $J$ are given in Hz. The peak patterns are indicated as follows: s, singlet; d, doublet; t, triplet; m, multiplet; q, quartet. IR spectra were recorded on a NEXUS FT-IR spectrometer. High resolution mass spectra were recorded on either a Q-TOF mass spectrometry or a GC-TOF mass spectrometry. TLC was carried out on SiO$_2$ (silica gel 60 F$_{254}$, Merck), and the spots were located with UV light, iodosplatinic reagent or 1% aqueous KMnO$_4$. Flash chromatography was carried out on SiO$_2$ (silica gel 60, 200-300 mesh) or basic Al$_2$O$_3$ (Al$_2$O$_3$ 90, 100-200 mesh). The starting materials 3a and 3b are commercially available.

2. Preparation and Characterization of Starting Materials

(1) Representative procedure for preparation of starting materials 1a-1d and 1l-1n:

To a solution of thiophene-2-carbaldehyde (1.12 g, 10 mmol) in MeOH (50 mL) at 0 °C, NaBH$_4$ (0.19 g, 5 mmol) was added slowly. After the resulting mixture was stirred overnight at room temperature, water (10 mL) was added slowly to quench the reaction. The product was extracted with ethyl ether (50 mL × 2), and the combined organic layers were washed with brine ((50 mL × 2), dried over Na$_2$SO$_4$. The solvent was removed under reduced pressure, and the residue obtained was purified via silica gel chromatography (eluent: petroleum ether/ethyl acetate = 5:1) to afford thiophen-2-ylmethanol as a colorless oil (1.08 g, 95% yield).

To a solution of thiophene-2-ylmethanol (0.60 g, 5 mmol) in CH$_2$Cl$_2$ (20 mL) at 0 °C, thionyl chloride (SOCl$_2$, 0.73 mL, 10 mmol) was slowly added. The resulting mixture was stirred overnight at room temperature, and then the solvent and excess of SOCl$_2$ were removed under reduced pressure. The residue obtained was dissolved in CH$_2$Cl$_2$
(20 mL), washed with saturated sodium bicarbonate solution, and dried over Na$_2$SO$_4$. Representative Procedure for Obtaining Products 2a–2d and 6a–6g:
Allyltributylstannane (165.56 mg, 0.5 mmol) and 1a (66.31 mg, 0.5 mmol) were added to a solution of Pd$_2$(dba)$_3$ (22.90 mg, 0.025 mmol) and PPh$_3$ (26.23 mg, 0.1 mmol) in acetone (3 mL) or CH$_2$Cl$_2$ (3 mL) at room temperature. The reaction mixture was stirred under N$_2$ atmosphere at room temperature. The reaction progress was monitored by TLC. After the starting material 1a was consumed (10 h), 2-methylbenzoic acid (0.14 g, 1 mmol) was added into the mixture. The resulting mixture was stirred at room temperature for another 10 h, and then, the solvent was removed under reduced pressure. The residue obtained was purified by column chromatography on basic alumina (eluent: petroleum ether) to afford 2-allyl-5-methylthiophene (2a) in 60% yield (41.5 mg) as a colorless oil.
