A catemer-to-dimer structural transformation in cyheptamide

S1 Differential Scanning Calorimetry Analysis

A sample of cyheptamide (9.4 mg) was placed in a pierced 10μL Al pan and heated from 293 – 478 K at a rate of 5 K min\(^{-1}\) on a Netzsch STA-449-C Jupiter simultaneous thermal analysis instrument (Fig S1). A small endotherm is observed with \(T_{\text{onset}} = 441.6\) K corresponding with cyheptamide form I → form II transition (Heat of transition = 5.291 kJ mol\(^{-1}\)) and a final melting endotherm for form II is observed at \(T_{\text{onset}} = 464.1\) K (Heat of fusion = 25.106 kJ mol\(^{-1}\)). No significant change in mass was observed during the experiment (data not shown). All analyses were performed using the Netzsch Proteus data analysis package.
