Crystal structures of 8-arylethynyl substituted guanosine derivatives:
are hydrogen-bonded ribbons a surprise?

Supporting Information

General Methods

All reactions were performed under nitrogen atmosphere in oven-dried glassware. Reagents and solvents were purchased from commercial suppliers and used without further purification. Compounds 8-bromo-2′,3′,5′-tri-O-acetylguanosine1 and PdCl₂(PPh₃)₂² were prepared according to literature procedures. Microwave-assisted reactions were performed in a Biotage Initiator 2.0 microwave reactor, producing monochromatic microwave radiation with the frequency of 2.45 GHz.

Mass spectral measurements were performed by the Mass Spectrometry Facility of the Department of Chemistry and Biochemistry at the University of Texas at Austin. NMR spectra were obtained on JEOL ECX-400 and ECA-500 spectrometers, with working frequencies (for ¹H nuclei) of 400 and 500 MHz, respectively. All ¹³C-NMR spectra were recorded with simultaneous decoupling of ¹H nuclei. ¹H-NMR chemical shifts are reported in ppm units relative to the residual signal of the solvent (CDCl₃: 7.26 ppm, DMSO-d₆: 2.50 ppm). All NMR spectra were recorded at 25 °C. Infrared spectra were recorded on a Perkin-Elmer Spectrum 100 FT-IR spectrophotometer using Pike MIRacle Micrometer pressure clamp. Microanalyses were conducted by Intertek USA, Inc. Melting points measurements were performed in open capillary tubes using Mel-Temp Thermo Scientific apparatus, and are uncorrected.

Column chromatography was carried out on silica gel 60, 32–63 mesh. Analytical TLC was performed on Merck aluminum-backed silica gel plates.

Experiments are presented in the order that follows the discussion of the manuscript.
Compound numbers are identical to those in the main text of the manuscript.
Synthesis of 4-[(Trimethylsilyl)ethynyl]benzonitrile

A mixture of 4-bromobenzonitrile (500 mg, 2.75 mmol), (trimethylsilyl)acetylene (1.98 mL, 13.7 mmol), PdCl$_2$(PPh$_3$)$_2$ (193 mg, 0.28 mmol), CuI (52 mg, 0.28 mmol), Et$_3$N (1 mL, 7.17 mmol), and MeCN (9.0 mL) was sealed in a thick-walled microwave pressure vial and exposed to microwave irradiation for 3 h at 90 °C. After cooling, solvents were removed under reduced pressure and the crude solid was purified by column chromatography, eluting with a hexane/ethyl acetate (91:9) mixture to collect the product. After removal of the solvent, the product was obtained as a yellow solid in 98% yield (538 mg, 2.70 mmol).

$^1$H NMR (CDCl$_3$, 400 MHz): $\delta$ 7.57 (d, $^3$J$_{H-H}$ = 8.2 Hz, 2H), 7.51 (d, $^3$J$_{H-H}$ = 8.2 Hz, 2H), 0.25 (s, 9H) ppm. $^{13}$C NMR (CDCl$_3$, 100 MHz): $\delta$ 132.58, 132.08, 128.13, 118.57, 111.92, 103.13, 99.70, −0.11. This data agrees with a previous literature report.$^3$

Synthesis of 4-[(Trimethylsilyl)ethynyl]pyridine

A mixture of 4-bromopyridine hydrochloride (3.00 g, 15.4 mmol), PdCl$_2$(PPh$_3$)$_2$ (271 mg, 0.39 mmol), and CuI (74 mg, 0.39 mmol) was placed in a 100 mL three-neck round-bottom flask. The flask was flushed with nitrogen gas, and degassed diisopropylamine (30 mL) was added into the flask while stirring at 40 °C, followed by the addition of (trimethylsilyl)acetylene (4.44 mL, 30.9 mmol). After 12 h, the reaction mixture was diluted with water (1 mL), extracted with CH$_2$Cl$_2$, dried over MgSO$_4$, and filtered. The solvent was removed under reduced pressure and the crude oil was purified by column chromatography, eluting with a hexane/ethyl acetate (89:11) mixture to collect the product. After removal of the solvent, the product was obtained as a dark brown oil in 96% yield (2.60 g, 14.9 mmol).

$^1$H NMR (CDCl$_3$, 400 MHz): $\delta$ 8.55 (dd, $^3$J$_{H-H}$ = 4.6 Hz, 5$^5$J$_{H-H}$ = 1.8 Hz, 2H), 7.30 (dd, $^3$J$_{H-H}$ = 4.6 Hz, $^5$J$_{H-H}$ = 1.8 Hz, 2H), 0.26 (s, 9H). This data agrees with a previous literature report.$^4$
Synthesis of 4-Ethynylbenzonitrile

In a nitrogen-flushed round-bottom flask, anhydrous K$_2$CO$_3$ (423 mg, 3.07 mmol) was added to a solution of 4-[(trimethylsilyl)ethynyl]benzonitrile (306 mg, 1.54 mmol) in a mixture of MeOH (3 mL) and THF (3 mL). After stirring for 30 min, the reaction mixture was filtered through celite. The solvent was removed under reduced pressure, to yield crude 4-ethynylbenzonitrile, which was used without purification in the next step. To minimize manipulations of this somewhat sensitive compound, we assumed a 95% yield for this reaction.

Synthesis of 4-Ethynylpyridine

In a nitrogen-flushed round-bottom flask, anhydrous K$_2$CO$_3$ (1.15 g, 8.30 mmol) was added to a solution of 4-[(trimethylsilyl)ethynyl]pyridine (64 mg, 3.69 mmol) in a mixture of MeOH (5 mL) and THF (5 mL). After stirring for 30 min, the reaction mixture was filtered through celite. The solvent was removed under reduced pressure, to yield crude 4-ethynylpyridine, which was used without purification in the next step. To minimize manipulations of this somewhat sensitive compound, we assumed a 95% yield for this reaction.

Synthesis of Compound 3

The entire amount of crude 4-ethynylbenzonitrile (prepared as above described) was added to a thick-walled microwave pressure vial containing a mixture of 8-bromo-2',3',5'-tri-O-
acetylguanosine (2, 500 mg, 1.02 mmol), PdCl₂(PPh₃)₂ (144 mg, 0.21 mmol), CuI (39 mg, 0.21 mmol), Et₃N (5 mL), and MeCN (5 mL). The vial was sealed and exposed to microwave irradiation for 3 h at 90 °C. After cooling, solvents were removed under reduced pressure and the crude solid was purified by column chromatography, eluting first with pure CH₂Cl₂, then with a CH₂Cl₂/MeOH (97:3) mixture, and finally with a 19:1 CH₂Cl₂/MeOH mixture. After removal of the solvent, the product was obtained as a yellow solid (mp >150 °C, with decomposition) in 83% yield (452 mg, 0.85 mmol). Single crystals of 3 were obtained by layering a chloroform solution of 3 (8 mg/mL) with pentane (crystals formed in 2 days).

UV-Vis (CH₂Cl₂): λ<sub>max</sub> (logε) = 266 (6.23), 348 (6.30) nm. IR (neat): 3710 (w, vN-H···N), 3461 (w, vN-H), 2968 (w, vC-H), 2230 (w, vC=O), 1739 (s, vC=O), 1367 (s, vC-N), 1229 (s, vC-O), 1033 (w, vN=C=N) cm⁻¹. ¹H NMR (CDCl₃, 500 MHz): δ 11.90 (br s, 1H), 7.74 (d, 3<sup>J</sup>H-H = 8.0 Hz, 2H), 7.68 (d, 3<sup>J</sup>H-H = 8.0 Hz, 2H), 6.90 (br s, 2H), 6.19 (dd, 3<sup>J</sup>H-H = 5.7 Hz, 3<sup>J</sup>H-H = 3.4 Hz, 1H), 6.13 (d, 3<sup>J</sup>H-H = 3.4 Hz, 1H), 6.08 (dd, 3<sup>J</sup>H-H = 6.3 Hz, 3<sup>J</sup>H-H = 5.7 Hz, 1H), 4.50 (dd, 2<sup>J</sup>H-H = 12.0 Hz, 3<sup>J</sup>H-H = 4.0 Hz, 1H), 4.38 (m, 1H), 4.30 (dd, 2<sup>J</sup>H-H = 12.0 Hz, 3<sup>J</sup>H-H = 5.7 Hz, 1H), 2.14 (s, 3H), 2.12 (s, 3H), 1.97 (s, 3H). ¹³C NMR (CDCl₃, 125 MHz): δ 170.87, 169.64 (2C), 158.44, 154.49, 151.22, 132.73, 132.36, 130.27, 125.92, 118.32, 118.16, 113.05, 93.09, 87.43, 81.80, 79.50, 72.90, 70.28, 62.92, 20.81, 20.75 (2C). HRMS (ESI): Caled for C<sub>25</sub>H<sub>23</sub>N<sub>6</sub>O<sub>8</sub>: 535.1572. Found: 535.1566. Synthesis of Compound 4

![Image of reaction scheme]

The entire amount of 4-ethynylpyridine (prepared as above described) was added to a thick-walled microwave pressure vial that contained a mixture of 8-bromo-2′,3′,5′-tri-O-acetylguanosine (2, 900 mg, 1.84 mmol), PdCl₂(PPh₃)₂ (259 mg, 0.37 mmol), CuI (70 mg, 0.37 mmol), Et₃N (5 mL), and MeCN (5 mL). The vial was sealed and exposed to microwave irradiation for 3 h at 90 °C. After cooling, solvents were removed under reduced pressure, and the crude solid was purified by column chromatography, eluting first with pure CH₂Cl₂, and then successively with CH₂Cl₂/MeOH mixtures in 97:3, 19:1, and 9:1 ratios. After removal of the
solvent, the product was obtained as a yellow solid (mp >127 °C, with decomposition) in 58% yield (546 mg, 1.07 mmol). Single crystals of 4 were obtained by layering a chloroform solution of 4 (4 mg/mL) with hexane (crystals formed in 7 days).

UV-Vis (CH2Cl2): \( \lambda_{\text{max}} (\log\varepsilon) = 267 (5.90), 336 (6.15) \) nm.
