Figure S1: Optical microscope images of crystals pag. S2
Figure S2: XRD patterns of calcium carbonate precipitates pag. S3
Figure S3: FTIR spectra of calcium carbonate precipitates pag. S4
Figure S4: Low-magnification SEM pictures of calcium carbonate precipitates pag. S5
Figure S1. Optical microscope images of crystals. The first column corresponds with the agarose viscous sol experiments; the second column with the agarose gel experiments and the third column with the agarose viscous sol adding Mg$^{2+}$ into the cation reservoir. (A-C) Precipitates in the absence of additives; (D-F) in the presence of *B. europaea* at concentration equal to *c* and (G-I) to 5*c*; (J-L) in the presence of *L. pruvoti* at concentration equal to *c* and (M-O) to 5*c*. Scale bars: 200 µm.
Figure S2. XRD patterns of calcium carbonate precipitates. The upper-figure corresponds with the high viscous sol experiments, the medium-figure with the gel experiments and the low-figure with the high viscous sol experiments adding Mg$^{2+}$ into the cation reservoir. The precipitates were obtained in the absence (A) and in the presence of organic macromolecules from *B. europaea*, at concentrations equal to *c* (B) and to 5c (C), and from *L. pruvoti*, at concentrations equal to *c* (D) and to 5c (E).
**Figure S3.** FTIR spectra of calcium carbonate precipitated in a high viscous sol adding Mg$^{2+}$ into the cation reservoir. The precipitates were obtained in the absence (A) and in the presence of organic macromolecules from *B. europaea*, at concentrations equal to $c$ (B) and to $5c$ (C), and from *L. pruvoti*, at concentrations equal to $c$ (D) and to $5c$ (E).
Figure S4. Low-magnification SEM images of calcium carbonate precipitates. The first column corresponds with the agarose viscous sol experiments; the second column with the agarose gel experiments and the third column with the agarose viscous sol adding Mg$^{2+}$ into the cation reservoir. (A-C) Precipitates in the absence of additives; (D-F) in the presence of *B. europaea* at concentrations equal to *c* and (G-I) to 5*c*; (J-L) in the presence of *L. pruvoti* at concentrations equal to *c* and (M-O) to 5*c*.
