Figure S1. Samples of the CNT-NMP dispersions with addition of different amounts of salt (NaI) and aging for 1 hour. The left sample (0) is the control CNT-NMP dispersion with no salt. There are visible aggregates in the samples 1-3 formed by self-assembly of CNTs stimulated by addition of the salt. The size of the aggregates increases with the increase of salt concentration.

Figure S2. Samples of the CNT-NMP dispersions with addition of different amounts of salt (NaI) and aging for 24 hours. We performed the centrifugation of all samples to extract bundles.
