Fig. S1. Maximum $^{13}$C NMR signal as a function of the mm-wave source output power. The measurements were performed at 1 K in a sodium $^{[1-^{13}C]}$acetate sample (sample type GlyHD66; see Table 1) irradiated at 196.85 GHz using the original mm-wave insert described in an early publication (ref. 19). The line connecting the data points is drawn to help guide the eye.
