### Supplementary Information

Reactions and equations are numbered to correspond with those given in the main text.

#### CH<sub>2</sub>I + NO<sub>2</sub>

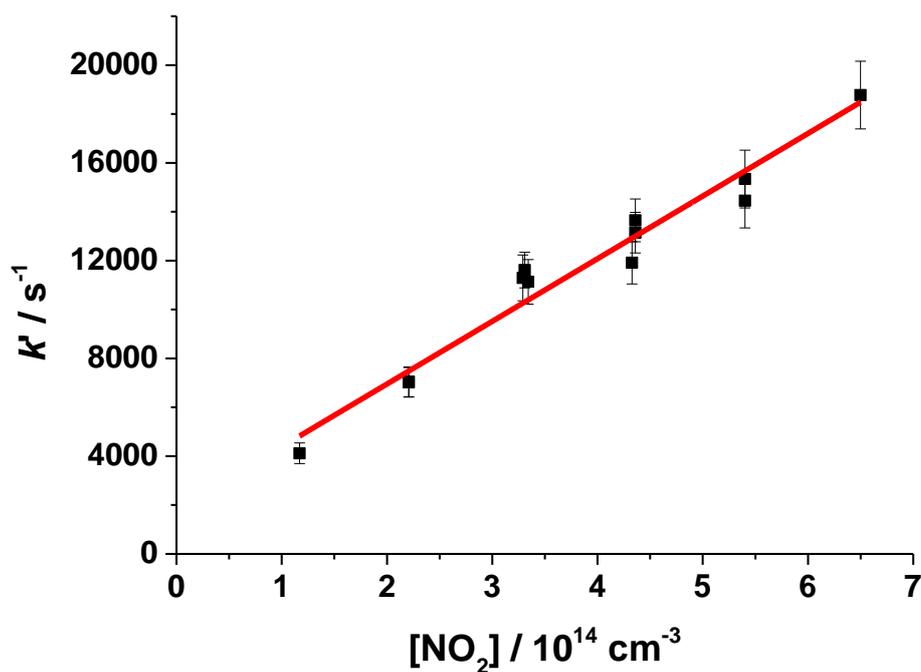

Figure S1: Pseudo-first-order rate coefficients ( $k'$ ) for HCHO production at 50 Torr, derived from fits to Equation 1, following photolysis of CH<sub>2</sub>I<sub>2</sub>/N<sub>2</sub> in the presence of NO<sub>2</sub>. Error bars are 1 $\sigma$ . The fit to the data (shown in red) gives the bimolecular rate coefficient for CH<sub>2</sub>I + NO<sub>2</sub> ( $k_8$ ).

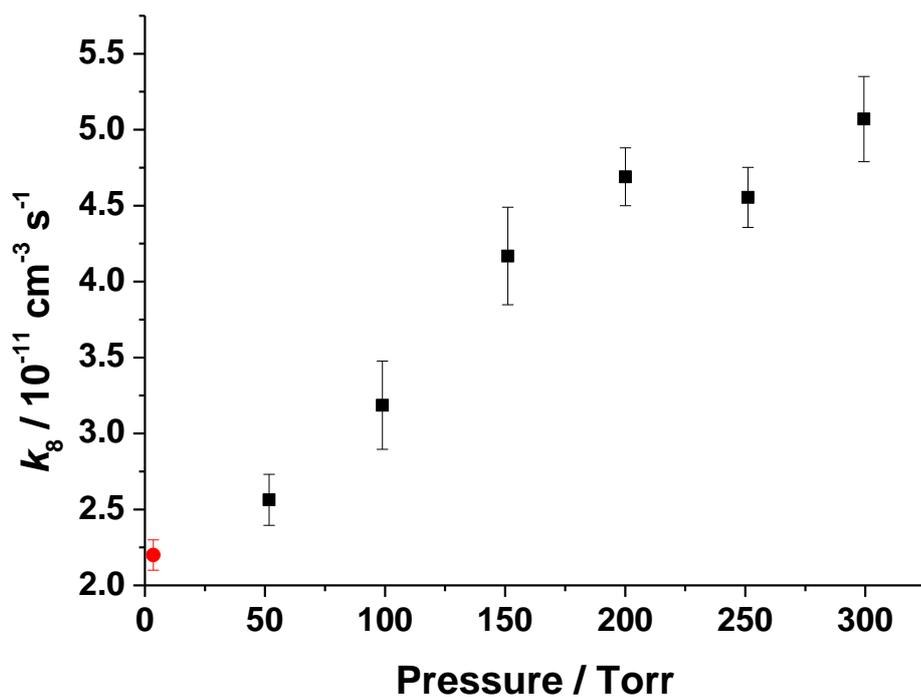

Figure S2: Bimolecular rate coefficients for  $\text{CH}_2\text{I} + \text{NO}_2$  ( $k_8$ ) as a function of pressure. The data point shown in red is that determined by Eskola *et al.*<sup>1</sup> Error bars are  $1\sigma$ .

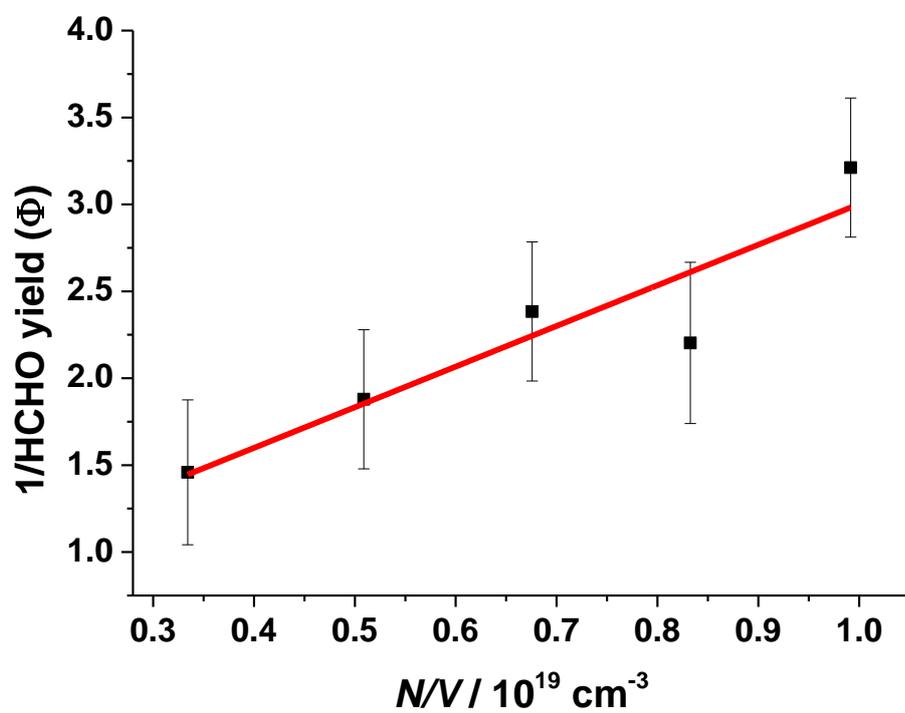

Figure S3: Stern-Volmer analysis for HCHO yields from  $\text{CH}_2\text{I} + \text{NO}_2$  (R8) as a function of total pressure, with the fit to the data (red). Error bars are  $1\sigma$ .

Pressure / Torr	$k_8 / 10^{-11} \text{ cm}^3 \text{ s}^{-1}$	Reference
2-5	$2.2 \pm 0.1$	Eskola <i>et al.</i> <sup>1</sup>
50	$2.56 \pm 0.17$	This work
100	$3.19 \pm 0.29$	This work
150	$4.17 \pm 0.32$	This work
200	$4.69 \pm 0.19$	This work
250	$4.55 \pm 0.20$	This work
300	$5.07 \pm 0.28$	This work

Table S1: Bimolecular rate coefficients for  $\text{CH}_2\text{I} + \text{NO}_2$  ( $k_8$ ) as a function of pressure. Errors are  $1\sigma$ .

## $\text{CH}_2\text{IO}_2 + \text{NO}$

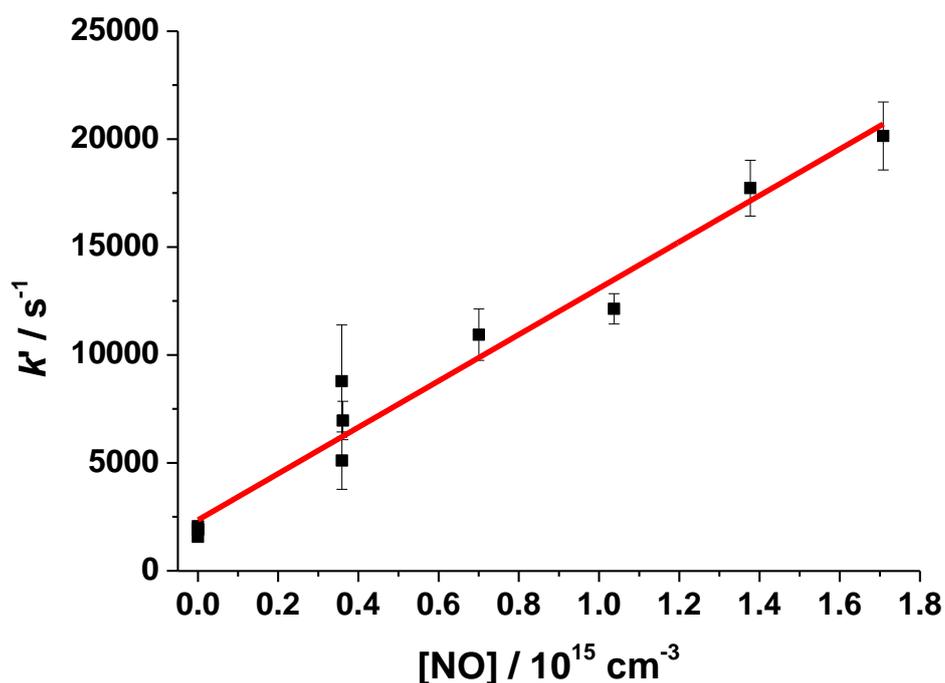

Figure S4: Pseudo-first-order rate coefficients ( $k'$ ) for the rapid HCHO production at 250 Torr, derived from fits to Equation 2, following photolysis of  $\text{CH}_2\text{I}_2/\text{O}_2/\text{N}_2$  in the presence of NO. Error bars are  $1\sigma$ . The fit to the data (shown in red) gives the bimolecular rate coefficient for  $\text{CH}_2\text{IO}_2 + \text{NO}$  ( $k_{10}$ ).

## CH<sub>2</sub>OO + NO<sub>2</sub>

The use of Equation 1 (main text) to describe HCHO production following photolysis of CH<sub>2</sub>I<sub>2</sub>/O<sub>2</sub>/N<sub>2</sub>/NO<sub>2</sub> mixtures was validated through simulations using the numerical integration package Kintecus.<sup>2</sup> Simulations were performed using the chemistry scheme described in Table S2 (below) to determine the rate coefficient for reaction of CH<sub>2</sub>OO with NO<sub>2</sub> by fitting to experimental data. Rate coefficients determined in this way were typically within 10 % of those obtained by fitting to the analytical expression (Equation 1, main text). All rate coefficients described in this work were obtained from the fits to Equation 1, with errors from the fit to the bimolecular plot combined with an additional error of ± 10 %.

Reaction	$k / \text{cm}^3 \text{s}^{-1}$ or $\text{s}^{-1}$	Reference
$\text{CH}_2\text{I} + \text{O}_2 \rightarrow \beta(\text{CH}_2\text{OO} + \text{I}) + (1-\beta) \text{CH}_2\text{IO}_2$	$1.5 \times 10^{-12}$	This work, Stone <i>et al.</i> , <sup>3</sup> Gravestock <i>et al.</i> , <sup>4</sup> Masaki <i>et al.</i> , <sup>5</sup> Eskola <i>et al.</i> <sup>6</sup>
$\text{CH}_2\text{OO} + \text{I} \rightarrow \text{HCHO} + \text{IO}$	$9.3 \times 10^{-11}$	Estimated <sup>a</sup>
$\text{CH}_2\text{IO}_2 + \text{CH}_2\text{IO}_2 \rightarrow 2 \text{CH}_2\text{IO} + \text{O}_2$	$9.0 \times 10^{-11}$	Gravestock <i>et al.</i> <sup>4</sup>
$\text{CH}_2\text{IO}_2 + \text{I} \rightarrow \text{CH}_2\text{IO} + \text{IO}$	$3.5 \times 10^{-11}$	Gravestock <i>et al.</i> <sup>4</sup>
$\text{CH}_2\text{IO} \rightarrow \text{HCHO} + \text{I}$	$1.0 \times 10^5$	Gravestock <i>et al.</i> <sup>4</sup>
$\text{CH}_2\text{OO} + \text{NO}_2 \rightarrow \text{HCHO} + \text{NO}_3$	-	This work
$\text{CH}_2\text{IO}_2 + \text{NO}_2 \rightarrow \text{CH}_2\text{IO}_2\text{NO}_2$	$3.8 \times 10^{-12}$	Estimated <sup>b</sup>
$\text{CH}_2\text{IO}_2\text{NO}_2 \rightarrow \text{CH}_2\text{IO}_2 + \text{NO}_2$	1.2	Estimated <sup>b</sup>

Table S2: Reactions and rate coefficients used in simulations of HCHO production in the CH<sub>2</sub>I<sub>2</sub>/O<sub>2</sub>/NO<sub>2</sub> system. The parameter β was used to vary the relative yields of CH<sub>2</sub>OO and CH<sub>2</sub>IO<sub>2</sub> in the simulations, with pressure-dependent values taken from our previous work. <sup>a</sup> The rate coefficient for CH<sub>2</sub>OO + I was estimated by modelling HCHO production from CH<sub>2</sub>IO<sub>2</sub> + I and CH<sub>2</sub>IO<sub>2</sub> + CH<sub>2</sub>IO<sub>2</sub> (using the rate coefficients shown in the table from Gravestock *et al.*<sup>4</sup>), followed by re-fitting the simulated data with the HCHO production occurring due to CH<sub>2</sub>OO + I and optimising  $k_{\text{CH}_2\text{OO}+\text{I}}$  to fit to the original simulation. Simulations were initialised with varying values for the rate coefficient describing the reaction between CH<sub>2</sub>OO and NO<sub>2</sub>, with the rate coefficient determined by fitting to the experimental data. <sup>b</sup> The rate coefficients for production and decomposition of CH<sub>2</sub>IO<sub>2</sub>NO<sub>2</sub> were estimated from the recommended values for the corresponding reactions CH<sub>3</sub>O<sub>2</sub> + NO<sub>2</sub> → CH<sub>3</sub>O<sub>2</sub>NO<sub>2</sub> and CH<sub>3</sub>O<sub>2</sub>NO<sub>2</sub> → CH<sub>3</sub>O<sub>2</sub> + NO<sub>2</sub> (values in the table are shown for 300 Torr, 298 K).

The use of Equation 3 (main text) to describe HCHO production in the presence of SO<sub>2</sub> or NO was described in our previous work.<sup>3</sup>

## CH<sub>2</sub>OO + CH<sub>3</sub>CHO

Low and high pressure limiting rate coefficients for the reaction between CH<sub>2</sub>OO and CH<sub>3</sub>CHO were approximated using the results of Taatjes *et al.*<sup>7</sup> at 4 Torr ( $k_{13} = (9.5 \pm 0.7) \times 10^{-13} \text{ cm}^3 \text{ s}^{-1}$ ), combined with those obtained in this work at 25 Torr ( $k_{13} = (1.48 \pm 0.04) \times 10^{-12} \text{ cm}^3 \text{ s}^{-1}$ ), 50 Torr ( $\sim 2.2 \times 10^{-12} \text{ cm}^3 \text{ s}^{-1}$ ) and the determination of  $k_{13b}/k_{13a}$  from the Stern-Volmer plot ( $k_{13b}/k_{13a} = (1.09 \pm 0.08) \times 10^{-18} \text{ cm}^3$ , Figure 13, main text).

Data were fitted to a simple Lindemann-Hinshelwood mechanism for chemical activation (Equations S1-S3 below), as shown in Figure S5, giving a low pressure limit ( $k_{13,0}$ ) of  $\sim 1.6 \times 10^{-29} \text{ cm}^6 \text{ s}^{-1}$  and a high pressure limit ( $k_{13,\infty}$ ) of  $\sim 1.7 \times 10^{-12} \text{ cm}^3 \text{ s}^{-1}$ .

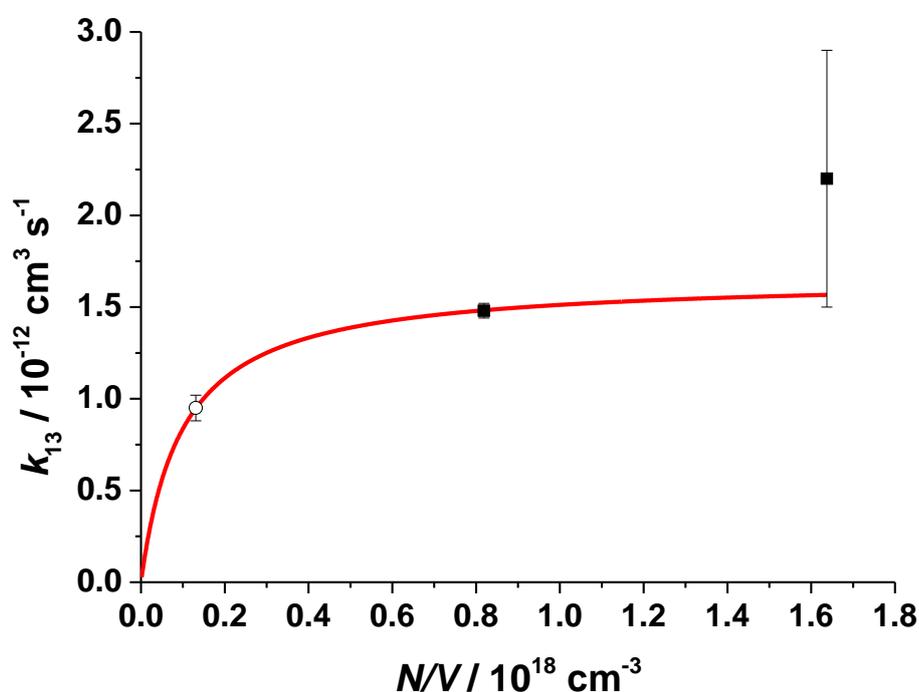

Figure S5: Data and fit to Equations S1-S3 used to estimate  $k_{13,0}$  and  $k_{13,\infty}$ . The low pressure data point (shown by the open circle) is taken from Taatjes *et al.*<sup>7</sup> Data points at higher pressures (shown by the filled squares), and the value for  $k_{13b}/k_{13a}$  ( $k_{CA}$  in Equations S1-S3) are those obtained in this work.

$$k_a = 1 + \left( \frac{k_{CA}}{[M]} \right) \quad \text{Equation S1}$$

$$k_b = \left\{ \left( \frac{1}{k_{13,0}} \right) + \left( \frac{k_{CA}}{k_{13,\infty}} \right) \right\}^{-1} \quad \text{Equation S2}$$

$$k_{13} = \frac{k_a k_b k_{13,\infty} [M]}{k_{13,\infty} + k_b [M]} \quad \text{Equation S3}$$

where  $k_{CA}$  is the slope of the Stern-Volmer plot describing yields of HCHO from  $\text{CH}_2\text{OO} + \text{CH}_3\text{CHO}$  as a function of pressure (i.e.  $k_{CA} = k_{13b}/k_{13a}$ ),  $M$  is the total number density ( $N/V$ ),  $k_{13,0}$  is the low pressure limiting rate coefficient for  $\text{CH}_2\text{OO} + \text{CH}_3\text{CHO}$  and  $k_{13,\infty}$  is the high pressure limiting rate coefficient for  $\text{CH}_2\text{OO} + \text{CH}_3\text{CHO}$ .
