Strain-assisted, low-temperature synthesis of high-performance thermoelectric materials

Sung-Jin Jung,ab Ju-Heon Kim,† Dong-IK Kim,† Seong Keun Kim,ad Hyung-Ho Park,b Jin-Sang Kim,a Dow-Bin Hyun,ae and Seung-Hyub Baek*aad

Figure S1: The change of density of ingot and strained samples as a function of annealing time.
**Figure S2**: Comparison of thermal conductivity measured by two different techniques. Blue circles and red squares represent the thermal conductivity measured by Harman method and laser flash method, respectively. For the latter, thermal conductivity was calculated from $\kappa = DC_P\lambda$, ($D$: density of the specimen, $C_P$: specific heat capacity, $\lambda$: thermal diffusivity). Thermal diffusivity was directly measured by laser flash method. $C_P$ is used based on Ref. S1.
