**Fig. S1.** Experimental cross sections for the reaction of Fe₁₅⁺ with CO as a function of kinetic energy in the lab frame (upper axis) and center-of-mass frame (lower axis).
Fig. S2. Zero-pressure extrapolated experimental cross sections (symbols) for the association reactions of $\text{Fe}_n^+$ where $n = 4 – 17$ (parts na - nb) with CO as a function of kinetic energy in the center-of-mass frame. The solid red lines in parts na are the model of eqn (1) using the single model parameters in Table 1. The dotted red lines show the model in the absence of experimental internal and kinetic energy distributions. Dashed lines in parts nb represent models of eqn (1) for the primary and secondary features and the red line shows their sum using the dual model parameters in Table 1. The locked dipole cross section of eqn (3) is also indicated by the blue lines.
