

Localization and dynamics of amylose-lipophilic molecules inclusion complex formation in starch granules

Marianna Manca^a, Albert J. J. Woortman^a, Andrea A. Mura^b, Katja Loos^{a*} and Maria Antonietta Loi^{a*}

Supplementary Information

Fig. S1: CLSM images of regular potato (a), waxy potato (d), regular corn (g) and waxy corn (l) starch granules in suspension 7 days after the addition of 5-hexadecanoylamino fluorescein molecules. The images b, e, h, m refer to the same starch species acquired after the “washing” procedure with 50% DMF. The images c, f, i, n refer to the same starch species acquired after the “washing” procedure with 90% DMF.
