All air sensitive reactions were carried out under an argon or nitrogen atmosphere. Room temperature (rt) refers to ambient temperature (20-22 °C), 0 °C refers to an ice slush bath and -78 °C refers to a dry ice acetone bath. Heated experiments were conducted using thermostatically controlled oil baths or Asynt aluminium heating blocks. Reactions were monitored by Thin Layer Chromatography (TLC) using aluminium backed silica gel 60 (F254) plates, visualised using UV254 nm, PMA, iodine, potassium permanganate and ninhydrin dips as appropriate. $^{13}$C-NMR spectra were recorded on a Bruker DPX-300 (300 MHz) or a Bruker DPX-400 (400 MHz). All chemical shifts are reported in ppm downfield from TMS (Me$_4$Si). Coupling constants ($J$) are reported in Hz. Multiplicity in $^1$H-NMR is reported as singlet (s), doublet (d), quartet (q), quintet (quin), octet (oct), sextet (sext), double doublet (dd), double triplet (dt), triple triplet (tt), broad singlet (br s), broad multiplet (br m) and multiplet (m). Mass spectra were recorded on an Esquire 2000. High resolution mass spectra were recorded on Bruker Micro ToF. Infrared spectra were recorded on PerkinElmer spectrum100. The optical rotations were measured on Optical Activity Ltd. AA-1000 Polarimeter. The Chiral HPLC measurements were carried out on HPLC consisting of a Gilson 811B Dynamic Mixer, a Gilson 805 Monometer Module, a Gilson 305 Piston Pump, Merck-Hitachi L-4000 UV detector linked to HEWLETT PACKARD 3396 Series II integrator with CHIRAL PAK IA/IB column (0.46 cm x 25 cm) or CHIRAL CEL OD-H/OD column (0.46 cm x 25 cm). The chiral GC measurements were done on HEWLETT PACKARD 5890 linked to HEWLETT PACKARD HP3396A integrator or PERKIN-ELMER 8500 chromatography linked to PC running DataApex Clarity software with Chrompak CP-Chirasil Dex CB column. Melting points were determined on a Stuart scientific melting point apparatus and are uncorrected. Purification of compounds was carried out by using flash column chromatography using silica gel of mesh size 230-400/ Florisil of mesh 100-200 or Kugelrohr distillation using BÜCHI GKR-51.

2. Experimental data for novel compounds and ketone/imine reduction products.

The following compounds have been reported and fully characterised, and were prepared as previously described; (2-hydroxyethylamino)TsDPEN 35 and its aminal precursor,\textsuperscript{1a} 3-((tert-butyldiphenylsilyl)oxy)propan-1-ol and 3-((tert-butyldiphenylsilyl)oxy)propanal, the precursors of 43,\textsuperscript{1b} 4-((tert-
butyldiphenylsilyl)oxy)butan-1-ol and 4-((tert-butyldiphenylsilyl)oxy)butanal, the precursors of 4,4'-o-phenoxy acetophenone, tert-butyl benzyl(2-oxo-2-phenylethyl)carbamate, 6,7-dimethoxy-1-methyl-3,4-dihydroisoquinoline. All other ketone substrates were used as purchased.

Synthesis of catalyst precursors and alcohol products.

Synthesis of 4-methylcyclohexa-1,4-dienecarboxylic acid (7). To a solution of propionic acid (25.0 g, 22.0 cm³, 357 mmol) in toluene was added, isoprene (25.3 g, 37.1 cm³, 371 mmol) and hydroquinone (0.55 g, 5.01 mmol). The reaction was fitted with a condenser and heated to 130 °C overnight. The reaction mixture was cooled to room temperature, and a solid precipitate was filtered off and washed with cold toluene to give carboxylic acid (7) (26.5 g, 0.193 mol, 54 %) as a white crystalline solid; Mp 181-184 °C; \( \nu_{\text{max}} \) 3675, 2963, 2882, 2631, 2532, 1701, 1666, 1645, 1425, 1282, 1161, 1097, 1035, 1027, 957, 922, 800, 780, 736 and 716 cm⁻¹; \( \delta_H \) (400 MHz, CDCl₃) 7.10 (1 H, br s, \( CH=CCO_2H \)), 5.48 (1 H, br s, \( CH=CC\)), 2.98-2.88 (2 H, m, \( CH_2C=CH \)), 2.82-2.72 (2 H, m, C=CCH₂) and 1.70 (3 H, s, \( CH_3 \)); \( \delta_C \) (101 MHz, CDCl₃) 172.44 (COOH), 139.17 (CH), 129.23 (C), 127.07 (C), 118.55 (CH), 31.99 (CH₂), 25.48 (CH₂), 22.76 (CH₃); \( m/z \) (ESI-MS) 137.0 [M-H]⁺. Synthesis of (4-methylcyclohexa-1,4-dien-1-yl)methanol (8). 4-Methylcyclohexa-1,4-dienecarboxylic acid (7) (5.64 g, 40.8 mmol) in THF (50 cm³) was added dropwise to a solution of LiAlH₄ (4.64 g, 123 mmol) in THF (250 cm³) with stirring at 0 °C. After addition, the solution was allowed to stir at r.t. over the weekend. The solution was then cooled to 0 °C and quenched with a 50 : 50 mixture of water and THF (50 cm³: 50 cm³), followed by water (50 cm³). Rochelle salt (40 g, 142.12 mmol) was then added followed by DCM (75 cm³) and was further allowed to stir for 3 hrs. As the Rochelle salt absorbs all the water, the remaining solution was
then filtered off through celite, dried (MgSO₄), filtered and concentrated to give the alcohol (8) as a white solid (4.1 g, 33.1 mmol, 81%); Mp 39-43 °C; νmax 3361, 2963, 2908, 2818, 1429, 1338, 1185, 1140, 1065, 1001, 949, 904, 835 and 783 cm⁻¹; δH (400 MHz, CDCl₃) 5.70 (1 H, s, C=CH₂OH), 5.45 (1 H, s, C=CH₃), 4.03 (2 H, s, C₂H₂OH), 2.72-2.65 (2 H, m, C₂H₂C=CH), 2.64-2.58 (2 H, m, C=CC₂H₂) and 1.68 (3 H, s, CH₃); δC (101 MHz, CDCl₃) 134.85 (C), 131.11 (C), 120.30 (CH), 118.25 (CH), 67.08 (CH₂), 31.26 (CH₂), 27.43 (CH₂) and 23.02 (CH₃); m/z (ESI-MS) 271.2 [2M+Na]⁺. Found (ESI-HR-MS): 271.1673 [2M+Na]⁺, C₁₆H₂₄NaO₂ requires 271.1669 (-1.6 ppm error).
