Supporting Information

CuO@Ag as A Highly Active catalyst for Oxidation of 

*trans*-Stilbene and Alcohols

Zhengmao Ye, Lei Hu, Jiang Jiang, Jianxin Tang, Xueqin Cao, Hongwei Gu

Synthesis of Ag NWs:
In a typical synthesis, 3mL ethylene glycol solution of AgNO₃ and 3 mL ethylene glycol solution of poly(vinyl pyrrolidone) (Aldrich, Mw≈55,000) were added dropwise (simultaneously) to the hot solution over 6 min, and the reaction continued at 160 °C for another 60 min. To purify the product, the final dispersion was separated by adding acetone (20ml), and centrifugation (2000rpm, 20min). The NWs were washed three times by ethanol (10mL) and acetone (20ml) and dispersed in ethanol.

Synthesis of CuO@Ag NWs:
In this case, the Ag NWs were re-dispersed in 20 mL of EG with magnetic stirring and 20mg cupric acetate was added. After the cupric acetate dissolved, the temperature was then raised to 180 °C and keep at this temperature for 30 min. Subsequently, the reaction mixture was cooled to room temperature naturally, the products were precipitated by adding EtOH, and finally the products were retrieved by centrifugation, and washed with ethanol several times. The nanowires were disperisible in water or EtOH.

General procedure for Catalytic epoxidation of stilbene over CuO@Ag NWs:
Catalyst testing was carried out in a sealed tube. 100μL CuO@Ag NWs (0.5mg) in EtOH, 0.2mmol trans-stilbene and a certain solvent (2 mL) were added. The reactions were took place at a certain temperature under air. Resulting product mixtures were analysed by GC-MS (VARIAN 450-GC & VARIAN 240-GC) equipped with a CP8944 capillary column (30 m × 0.25 mm) and a FID detector. All catalytic tests were repeated three times.

General procedure for Catalytic oxidation of alcohols over CuO@Ag NWs:
Catalyst testing was carried out in a sealed tube. 100μL CuO@Ag NWs (0.5mg) in EtOH, alcohols (1 mmol), TBHP (2.5 mmol) and a certain solvent (2 mL) were added into the glass reactor. The reactions were took place at a certain temperature under oxygen atmosphere. Resulting product mixtures were analysed by GC-MS (VARIAN 450-GC & VARIAN 240-GC) equipped with a CP8944 capillary column (30 m × 0.25 mm) and a FID detector. All catalytic tests were repeated three times.
