Magnetically recoverable AuPd nanoparticles prepared by a coordination capture method as reusable catalyst for green oxidation of benzyl alcohol

Tiago A. G. Silva, Richard Landers and Liane M. Rossi*

STEM images were acquired using a JEOL-JEM 2100F TEM microscope available at the LNNano Laboratory (CNPEM, Campinas, Brazil).

Figure S1. (a) TEM image of Fe₃O₄@SiO₂-NH₂AuPd. (b) and (c) TEM images with higher magnification of supported AuPd NPs. (d) size distribution histogram. Mean size 5.1±1.2 nm.
Figure S2. (a) STEM image of Fe₃O₄@SiO₂-NH₂AuPd(C) (calcined catalyst). (b) and (c) TEM images with higher magnification of supported AuPd NPs. (d) size distribution histogram. Mean size 6.8 nm (σ = 0.38).
Figure S2. (a) STEM image of Fe₃O₄@SiO₂-NH₂AuPd(C)R5 (calcined catalyst after 5 reuses). (b) and (c) TEM images with higher magnification of supported AuPd NPs. (d) size distribution histogram. Mean size 9.3 nm ($\sigma = 0.45$).
