Electronic Supporting Information Available.

Immobilization of Nano-TiO₂ (P25). Nano-TiO₂ powder (1.0 g) was first suspended with sonication in 20.0 mL of ethanol. Then 5.0 g of polyethylene glycol (PEG) aqueous solution (65 wt %) were added under violent stirring to obtain the suitable viscosity for next immobilization adhesive ability. The mixture was slowly pasted on a circle glass sheet (Φ100 mm) with a soft brush and then dried at 120 °C for 30 min in an oven. Nextly, the immobilized TiO₂ film was anneal at 450 °C in air for 2 h to purify the TiO₂ phase. The final amount of nano-TiO₂ immobilized on the glass sheet was 85±5 g/m². Finally, the immobilized nano-TiO₂ photocatalyst was introduced into the reactor for the comparative photocatalytic experiments.
