Materials and characterization
HiPco-SWNTs (0.7~1.2 nm diameter) are purchased from Unydim and used as received. Toluene (spectra analysis grade) was purchased from Tokyo Chemical Industry Co., LTD. Japan. Synthesis of a new SWNT solubilizer is described below.

Synthesis Scheme

**Synthesis of 4,5-bis (dodecylthio)benzene-1,2-diamine**

**Synthetic scheme**

In a 300-mL three-necked flask, xantphos (600 mg, 1 mmol), 4,5-dibromo-1,2-phenylenediamine (2.66 g, 10 mmol), Pd$_2$(dba)$_3$ (456 mg, 0.5 mmol), 1,4-dioxane (100 mL) were placed, then removed oxygen under vacuo, to which triethylamine (6 mL, 30 mmol), 1-dodecanethiol (7.5 mL, 50 mmol) were added,
then removed oxygen again under vacuo. The obtained solution was heated at 110 °C for 3.5 h. After evaporating the solvent, the obtained crude sample dissolved in hexane and store in a refrigerator for one night to obtain a white solid, which was dried under vacuo for 3 h. The obtained product (yield, 4.2g) was used for the next step.

Synthesis of a precursor of ddtC12 (4,5-bis (dodecylthio)benzene-1-N-dodecyl,2-amine)

The synthesis of a precursor of ddtC12 was carried out by the reaction of 4,5-bis (dodecylthio)benzene-1,2-diamine (1.52 g, 3 mmol) and n-dodecyl chloride (0.36 mL, 1.5 mmol) in THF (5 mL) containing triethylamine (10 mL) at reflux temperature for 64 h under N₂ flow. Then, THF and triethylamine were removed by evaporation, followed by gel chromatographic technique (eluent: hexane/ethyl acetate = 4/1 v/v). By the removal of the solvent from the obtained solution, a crude product (1.5 g) was provided, which was used for the next step.

Synthesis of ddtC12

Synthetic scheme

\[
\text{C}_{12}\text{H}_{25}\text{S} + \text{HO-N=O} \xrightarrow{\text{B}_2\text{O}_3, \text{CH}_3\text{COOH}} \text{C}_{12}\text{H}_{25}\text{S-N=N-O}
\]
```

The precursor (1.51 g) and alloxane monohydrate (0.284 g, 2 mmol) were reacted in acetic acid (60 mL) containing B₂O₃ (0.42 g, 6.0 mmol) at 60 °C for 17.5 h. After adding sodium carbonate to neutralize the solution, then extracted using water and chloroform. After the separation of the organic phase, MgSO₄ was added and stored for overnight. By the solvent removal, a crude product was obtained, which was purified by chromatography (silica gel; eluent: hexane/ethyl acetate = 1/1 v/v, then 1/2 v/v) . Evaporation of the solvents provided a red-colored solid (64 mg), which was characterized by ¹H NMR and MS analyses.
SWNT solubilization and characterization

Typical SWNT solubilization procedure is as follows. The SWNTs and ddtC12 were placed in a glass vessel, then sonicated in toluene for 1 h using a bath-type sonicator (Branson, 5510) followed by centrifugation at 10,000 g (25 °C) for 1 h using a centrifuge (Hitachi-Koki, Himac CF-15R). The supernatant (top 80%) was collected for use in UV-vis-NIR absorption (JASCO, V670) and Raman (Nanophoton Corporation, RAMANtouch, excitation at 633-nm) spectral measurements. Molecular orbital (HOMO and LUMO) calculations were carried out using a Gaussian 09 software (exchange-correlation function: B3LYP/6-311G). The molecular-mechanics simulations were carried out by using the MacroModel program (Schrodinger, version 10.2) with the OPLS-2005 force field. The dielectric constant of toluene (2.3) was used in the calculations. Minimization of the calculations was carried out by using the Polak-Ribiere conjugate gradient
