1. Materials and methods

Unless otherwise noted, all reactions were carried out under inert atmosphere of dry N₂ using Schlenk or glovebox techniques. All reagents were purchased from commercial suppliers (Sigma Aldrich, Acros, TCI, VWR, Fluorochem, ABCR) and used without additional purification. B(C₆F₅)₃ was purified by sublimation under vacuum prior to use. Dry solvents were obtained from a solvent purification system with aluminum oxide column (Innovative Technologies). The triazenes 1–7 were prepared according to published procedures. NMR spectra were recorded on Bruker spectrometers: AvanceIII 400 MHz Prodigy probe 5 mm ICONNMR ATMA, Avance 400 MHz BBlz 5mm ATMA, Avance 500 MHz CPTCIxyz 5 mm, or Avance III HD 600 MHz CPTCIz 5 mm. Chemical shifts in ppm were aligned with respect to the residual peak of deuterated solvent. Electrospray-ionization HRMS data were acquired on a Q-Tof Ultima mass spectrometer (Waters) or a Q-Tof 6530 Accurate mass spectrometer (Agilent) operated in the positive ionization mode and fitted with a standard Z-spray ion source equipped with the Lock-Spray interface. IR spectra were recorded on a Perkin Elmer (UATR Two) spectrometer, using PerkinElmer Spectrum software (V 10.5.4).
2. NMR study of 1(HOTf)

In a Schlenk tube, a solution of triazene 1 (19 mg, 0.1 mmol) in CD$_2$Cl$_2$ (1.8 mL) was cooled down to –78 °C and HOTf (27 µL, 45 mg, 0.3 mmol) was added slowly under vigorous stirring. After 20 min, an aliquot (0.5 mL) of the reaction mixture was rapidly transferred into a J-Young NMR tube under N$_2$ flow maintaining the temperature at –78 °C. NMR measurements were performed in a precooled Bruker AV NEO-400 instrument (–75 °C). NMR data for 1(HOTf): $^1$H NMR (400 MHz, CD$_2$Cl$_2$) δ 11.98 (s, 1H), 7.43–7.41 (m, 2H), 7.22–7.20 (m, 2H), 4.22–4.19 (br m, 2H), 3.88–3.84 (br m, 2H), 2.31 (s, 3H), 2.30–2.27 (br m, 2H), 2.16–2.14 (br m, 2H). $^{13}$C NMR (101 MHz, CD$_2$Cl$_2$) δ 138.70, 135.11, 130.24, 117.01, 57.26, 51.53, 23.58, 23.25, 20.92.

3. NMR study of 3(HOTf)

In a Schlenk tube, a solution of triazene 3 (37 mg, 0.1 mmol) in CD$_2$Cl$_2$ (1.8 mL) was cooled down to –78 °C and HOTf (27 µL, 45 mg, 0.3 mmol) was added slowly under vigorous stirring. A color change from yellow to red-orange was observed. After 20 min, an aliquot (0.5 mL) of the reaction mixture was rapidly transferred into a J-Young NMR tube under N$_2$ flow maintaining the temperature at –78 °C. NMR measurements were performed in a precooled Bruker AV NEO-400 instrument (–75 °C). **Warning:** 3(HOTf) in solution rapidly decomposes with active gas evolution at temperatures higher than –75 °C. This point should be taken into consideration when carrying such experiments. The J-Young NMR tube should be equipped for overpressure. NMR data for 3(HOTf): $^1$H NMR (400 MHz, CD$_2$Cl$_2$) δ 11.82 (s, 1H), 11.64 (s, 1H), 7.54–7.51 (m, 3H), 7.45–7.32 (m, 10H), 7.21–7.05 (m, 5H), 6.95–6.92 (m, 2H). $^{13}$C NMR (101 MHz, CD$_2$Cl$_2$) δ 138.71, 138.24, 136.20, 135.90, 133.95, 130.98, 130.87, 130.84, 130.51, 130.47, 129.70, 129.60, 129.45, 128.83, 128.46, 127.92, 122.76, 119.61, 116.84, 116.46, 113.31.

9. Crystallographic data

Bragg-intensities of \(2(\text{HOTf})\), \(5(\text{HOTf})\), \(6(\text{HOTf})\), \(8\), \(9\), \(10\) and \(11\) were collected at low temperature (See Table S9.1) using \(\text{CuK}\alpha\) radiation. A Rigaku SuperNova dual system diffractometer with an Atlas CCD detector was used for compounds \(2(\text{HOTf})\), \(6(\text{HOTf})\), \(8\), \(9\) and \(11\), and one equipped with an Atlas S2 CCD detector for compounds \(5(\text{HOTf})\) and \(10\). The datasets were reduced and corrected for absorption, with the help of a set of faces enclosing the crystals as snugly as possible, with \(\text{CrysAlisPro}\).\(^3\)

The solutions and refinements of the structures were performed by the latest available version of \(\text{ShelXT}\)^4 and \(\text{ShelXL}\).\(^5\) All non-hydrogen atoms were refined anisotropically using full-matrix least-squares based on \(|F|^2\). The hydrogen atoms were placed at calculated positions by means of the “riding” model where each H-atom was assigned a fixed isotropic displacement parameter with a value equal to 1.2 \(U_{eq}\) of its parent C-atom (1.5 \(U_{eq}\) for the methyl groups), but in the structures \(2(\text{HOTf})\), \(5(\text{HOTf})\) and \(6(\text{HOTf})\) the hydrogen atom bound to nitrogen (N1) was found in a difference map and refined freely.

Crystallographic and refinement data are summarized in Table S9.1. Crystallographic data have been deposited with the Cambridge Crystallographic Data Centre and correspond to the following codes: \(2(\text{HOTf})\) (1966935), \(5(\text{HOTf})\) (1966936), \(6(\text{HOTf})\) (1966937), \(8\) (1967012), \(9\) (1966938), \(10\) (1963420), and \(11\) (1966939). These data can be obtained free of charge via www.ccdc.cam.ac.uk/data_request/cif, or by emailing data_request@ccdc.cam.ac.uk, or by contacting The Cambridge Crystallographic Data Centre, 12 Union Road, Cambridge CB2 1EZ, UK; fax: +44 1223 336033.

In the structure \(8\), an isopropyl and a tert-butyl groups are disordered over two positions found in a difference map and which were refined anisotropically imposing distance and similarity restraints (SADI and SIMU) for the least-squares refinement, yielding site occupancies of 0.654(8)/0.346(8).

In the structure \(9\), one of the isopropyl groups is disordered over two orientations each, found in a difference map. These were anisotropically refined imposing distance and similarity restraints (SADI and SIMU) for the least-squares refinement which yielded site occupancies of 0.706(17)/0.294(17).

To compare the bond lengths of the protonated triazenes with aryl triazenes, a CCDC database search was performed. For the search, the program ConQuest (v2.0.1, CCDC 2019) was used with a CCDC database (CSD version 5.40 (November 2018) + 2 updates). The query that was searched:

\[
\begin{array}{c}
\text{R-} \quad \text{N}_3 \quad \text{N}_2 \quad \text{N}_1 \quad \text{H} \quad (\text{R})_n \\
\end{array}
\]

With the following additional requirements: R = any atom except H, R’ = one or multiple substituents (n), Filter = only organics and must not contain:

The resulting 122 hits were analysed and taken out of the data set if:

1. The triazene is cyclic.
2. It contains any other atom than H, C, N, O, F, Cl, Br, S.
3. The amount of connected N atoms > 3.
4. R is another atom than C, or if R is C–O.
5. No coordinates are available in the database.
7. \((\text{R'})_n > 21\) atoms (excl. H).

The resulting 30 hits were analysed with Mercury (v3.10, CCDC 2001-2017) and the bond lengths were measured.

30 Structures from the CCDC database:

BOCYUO, BOCZAV, BOCZEZ, BOCZID, CMPDZB, DEHFUT, EMUDEX, FUZLUI, HAHQOZ, HOBXAY, IPUDEE, IPUDII, JANXAA, JANXEE, JANXII, JOLNED, JOWTOE, KUJXOC, LOXWOM, MIJDEP, MTZPCX, OFUBUO, OPAVUX, PIGRUT, PIGSAA, RUJQIX, UDINEC, VUYGEB, YUMWIO, ZIKQOZ.

Average bond lengths: N1-N2 = 1.276 Å; N2-N3 = 1.325 Å
To compare the bond lengths of the B–N dative bonds with B(C₆F₅)₃, a CCDC database search was performed. For the search, the program ConQuest (v2.0.1, CCDC 2019) was used with a CCDC database (CSD version 5.40 (November 2018) + 2 updates).

The query that was searched: $^{\text{c}} \text{R} \text{N} \equiv \text{B(C}_6\text{F}_5\text{)}_3$

The resulting 184 hits were analysed and taken out of the data set if:

1. $\text{R}$, $\text{R'}$ contains any other atom than C, H, N, (O).
2. The B–N adduct is charged.
3. No coordinates available.

The resulting 46 hits were analysed with Mercury (v3.10, CCDC 2001-2017) and the bond lengths were measured.

46 Structures from the CCDC database:

AGASAF, BAZRIE, BUNXEO, DERGOZ, DERGUF, EKUBOB, EKUBUH, FEYHIB, GABQUW, GABRAD, HAFFAX, IFUFIA, IJOHAQ, IJOHEU, IJOHIY, IPAPIA, IPAPOG, JEGKUC, KECRUG, MIVLOS, MIVLUY, MIVMAF, MIVMEJ, MIVMIN, MOJVOX, NOWJEQ, OGACUX, PIKDAQ, PIKfas, QEYSAO, RASQEI, RASQIM, RASQOS, RASQY, RASRAF, SELTIO, TURPOM, UKITUF, WAWCEE, WAWCII, XERWIC, XERWOI, XUCCIH, YALTAJ, YALTOX, ZIXEA.

Average bond length: B–N = 1.626 Å
