Scheme S1. $^1$H NMR of complex R in CDCl$_3$. 
Scheme S2. $^1$H NMR of complex 1 in DMSO-$d_6$.

Scheme S3. $^1$H NMR of complex 2 in DMSO-$d_6$. 

**Figure S1.** Overlap between the PL spectra of CAZ-SO$_3$Na (blue line) and TCAZ-SO$_3$Na (red line) and the absorption spectrum of [Ir(meoppy)$_2$(dmapzpy)]$^+$ (black line).

**Figure S2.** PL spectra of a) complex 1 and b) complex 2 in degassed CH$_3$CN solution under different excitation wavelengths.
Figure S3. PL spectra of a) complex R, b) complex 1 and c) complex 2 in 2 wt.% doped PMMA films under different excitation wavelengths. The sharp peaks at 300 and 600 nm originate from the light source of fluorospectrometer.
**Scheme S4.** Energy level (in eV) diagrams for the OLEDs using complexes R and 1-2.

The HOMO levels of the anions were calculated from the onsets of oxidation potentials and the LUMO levels were then calculated on the basis of HOMO levels and optical band gaps. The HOMO and LUMO levels of $[\text{Ir(meoppy)}_2\text{(dmapzpy)}]^+$ were calculated from the onsets of oxidation and reduction potentials, respectively.

**Figure S4.** Current-efficiency versus brightness curves for OLEDs based on complexes R and 1-2.
Figure S5. EQE versus brightness curves for OLEDs based on complexes R and 1-2.
