Fig. S1†. AFM distribution of heights

Fig. S2†. SEM micrographs of salt crystals formation in hydrated SLS after the freeze drying process. Scale bars are from left to right: 250 µm, 125 µm and 50 µm.
Fig. S3†. Pore size of dialyzed SLS. (A) N.S. indicates Non-significant differences between all groups. (B) SEM and Fluorescent microscopy images of SLS (Phalloidin/DAPI staining). (I) SEM image of a dialyzed SLS (dry). (II) Fluorescence microscopy of a dialyzed SLS (wet). (III) Fluorescence microscopy of a dialyzed SLS with 4*10⁶ cells/ml seeded. (IV) Fluorescence microscopy of a dialyzed SLS with 1,6*10⁷ cells/ml seeded. Scale bars are 300 µm

Supplementary video 1†. 3D-seeding of h-MSCs within SLS

Supplementary video 2†. General appearance and handling of hydrated SLS

Supplementary video 3†. Capacity of wet SLS to recover its initial morphology when reabsorb the lost water after a full compression
