1. General information

Reactions via general procedure were carried out under an atmosphere of oxygen unless otherwise noted. Column chromatography was performed using silica gel (200-300 mesh). $^1$H NMR and $^{13}$C NMR spectra were recorded on Bruker-AV (400 and 100 MHz, respectively) instrument using CDCl$_3$ or dimethyl sulfoxide-$d_6$ as solvent. Mass spectra were measured on Agilent 5975 GC-MS instrument (EI). High-resolution mass spectra (ESI) were obtained with the Thermo Scientific LTQ Orbitrap XL mass spectrometer. Melting points were measured with a YUHUA X-5 melting point instrument and were uncorrected. All reagents obtained from commercial suppliers were used without further purification. Cyclic voltammograms were recorded with a CHI830B potentiostat at room temperature in CH$_3$CN. $n$-Bu$_4$NBF$_4$ (0.1 M) was used as the supporting electrolyte, and a glass carbon electrode was used as the working electrode. The auxiliary electrode was a platinum wire electrode. All potentials are referenced against the Ag/AgCl redox couple. The scan rate was 100 mV•s$^{-1}$. PH is measured using a PH meter (PHS-3BW). Two standard buffer solutions with pH values of 6.86 and 4.00 at 25°C were used to calibrate the electrode system.

4.2. Stern-Volmer fluorescence quenching experiments

**Formulation solution:** 2-Mercaptobenzimidazole (7.5 mg) was dissolved in DMF in a 5 mL volumetric flask to set the concentration to be 0.01 M. Dissolve the photocatalyst Rose Bengal (2.5 mg) in DMF in a 25 mL volumetric flask, shake well, take out 5 mL of the solution and make up to volume with DMF in a 25 mL volumetric flask, setting the concentration to 0.02 mM.

**Experimental procedure:** The resulting 0.02 mM solution (25 μL) was added to cuvette to obtain different concentrations of catalyst solution. This solution was then diluted to a volume of 2.0 mL by adding DMF to prepare a 0.25 μM solution. 10.0 μL of a 2-Mercaptobenzimidazole solution was successively added and uniformly stirred, and the resulting mixture was bubbled with nitrogen for 3 minutes and irradiated at 521 nm. Fluorescence emission spectra of 0 μL, 10.0 μL, 20.0 μL, 30.0 μL, 40.0 μL fluorescence intensity. Follow this method and make changes to the amount to obtain the Stern–Volmer relationship in turn. The solution was excited at λ = 521 nm.

We performed another Stern–Volmer fluorescence quenching experiment to investigate the influence of oxygen. In a typical experiment, 2.0 mL of solution of Rose Bengal in DMF was bubbled a stream of oxygen for several seconds. The solution was excited at λ = 521 nm.

From the result, \( E_{1/2}^{ox} = 0.361 \) V vs SCE in CH\(_3\)CN was obtained.
