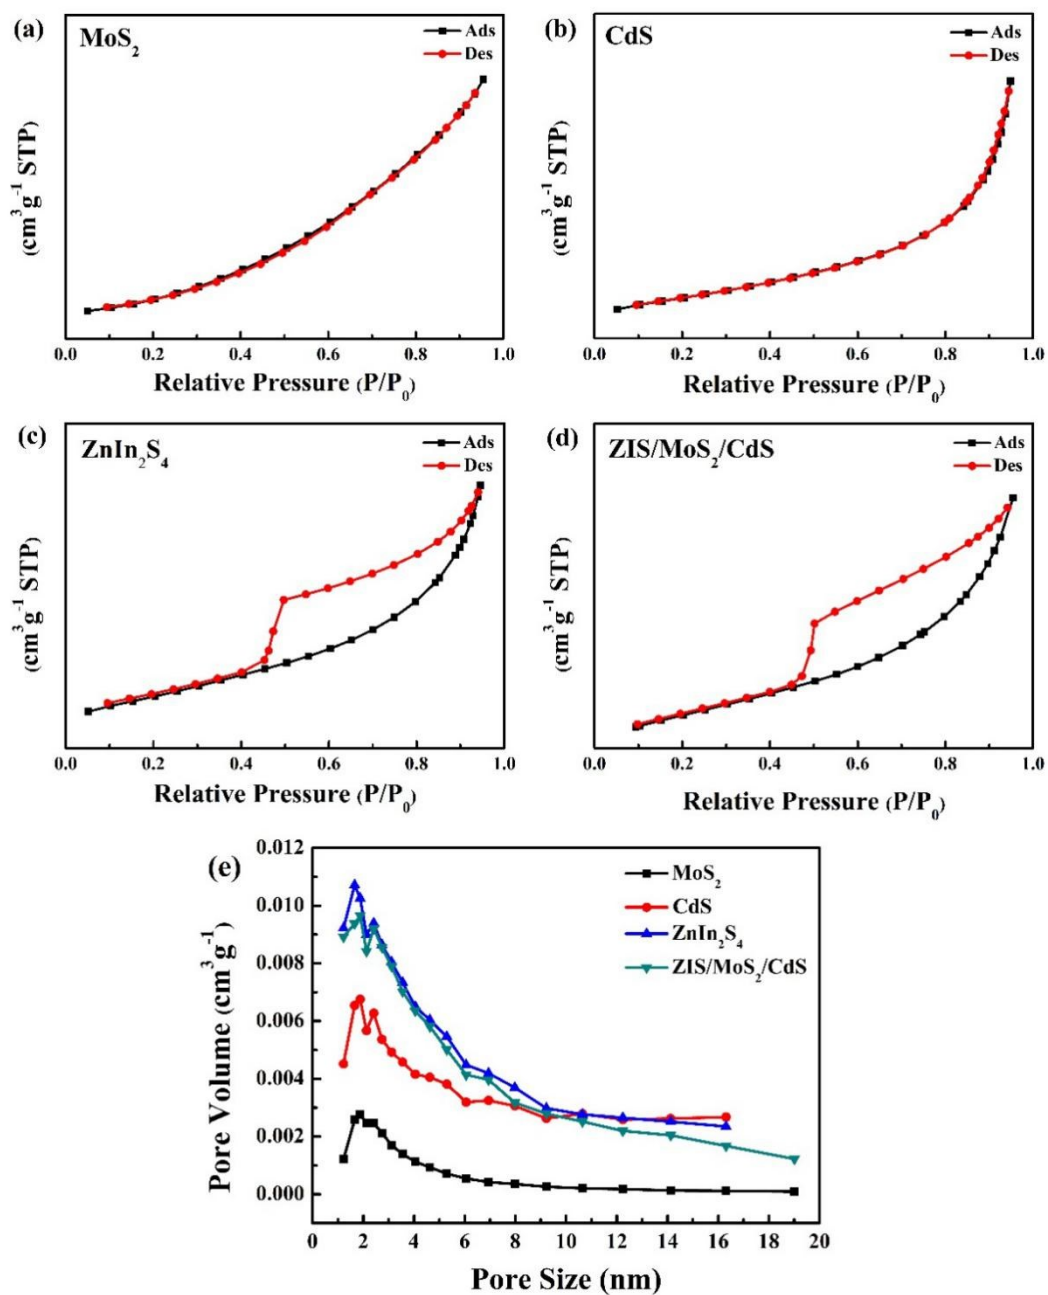

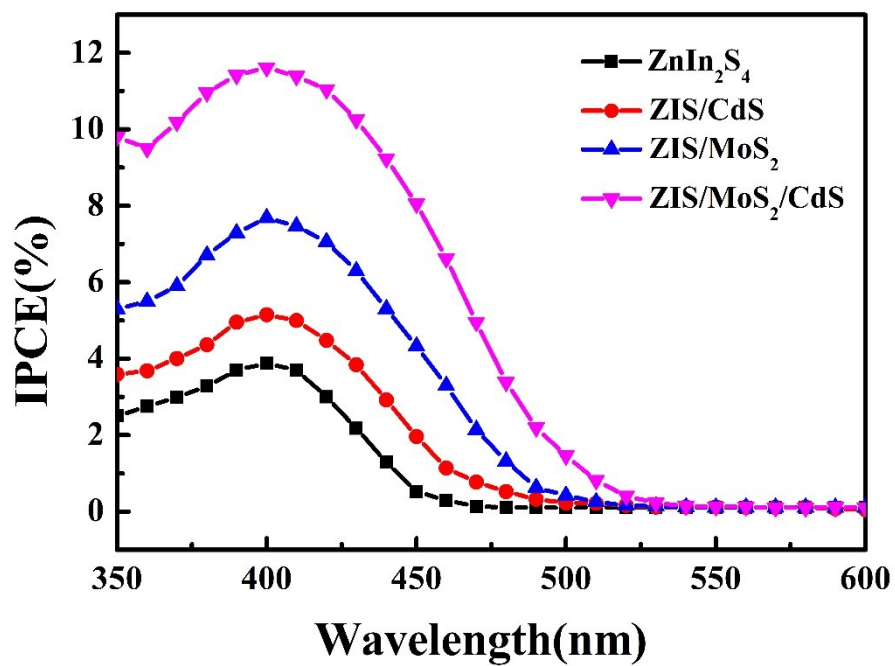

Figure S1 EDS spectrum of ZIS/MoS<sub>2</sub>/CdS composite

**Figure S2** (a-d) Nitrogen adsorption-desorption isotherms and (e) corresponding the Barrett-Joyner-Halenda (BJH) pore size distribution curves of MoS<sub>2</sub>, CdS, ZnIn<sub>2</sub>S<sub>4</sub> and ZIS/MoS<sub>2</sub>/CdS samples

**Fig. S3.** IPCE spectra of the samples collected at the incident wavelength range from 350 nm to 600 nm at a potential of 1.23 V vs. RHE in 0.1M NaOH electrolyte.

**Table S1.** BET surface area, pore size, pore volume of the synthesized composite.

Samples	$S_{BET}$ (m <sup>2</sup> /g)	Pore Size (nm)	Pore volume (cm <sup>3</sup> /g)
MoS <sub>2</sub>	3.1665	10.754	0.008513
CdS	22.558	10.864	0.061268
ZnIn <sub>2</sub> S <sub>4</sub>	34.924	8.5996	0.075082
ZIS/MoS <sub>2</sub> /CdS	37.629	7.7897	0.07328

**Table S2.** The apparent quantum efficiency (AQE) of MoS<sub>2</sub>, CdS, ZnIn<sub>2</sub>S<sub>4</sub>, ZIS/CdS, MoS<sub>2</sub>/CdS, ZIS/MoS<sub>2</sub> and ZIS/MoS<sub>2</sub>/CdS

The apparent quantum efficiency (AQE) was analyzed with a wavelength of 420 nm under the 300 W Xe lamp (PLS-SXE300) irradiation. The other experimental conditions were similar to the photocatalytic hydrogen evolution measurement as described before. The light intensity was obtained with an optical power meter (PL-MW2000, Beijing Perfectlight Co. Ltd., China). For example, if 420 nm is used, the average light intensity is 20.4 mW cm<sup>-2</sup>. The irradiation area is 19.625 cm<sup>2</sup> (2.5 cm radius). The number of incident photons ( $N$ ) is  $1.8 \times 10^{22}$  calculated by equation (1). The amount of H<sub>2</sub> molecules generated for 6 h were about 4542.3 μmol. The AQE was then calculated in equation (2).

$$N = \frac{E\lambda}{hc} = \frac{20.4 \times 19.625 \times 10^{-3} \times 6 \times 3600 \times 420 \times 10^{-9}}{6.626 \times 10^{-34} \times 3 \times 10^8} = 1.8 \times 10^{22} \quad (1)$$

$$\begin{aligned}
 AQE &= \frac{\text{the number of reacted electrons}}{\text{the number of incident photons}} \times 100\% \\
 &= \frac{2 \times \text{the number of evolved } H_2 \text{ molecules}}{N} \times 100\% \quad (2) \\
 &= \frac{2 \times 6.02 \times 10^{23} \times 4542.3 \times 10^{-6}}{1.8 \times 10^{22}} \times 100\% = 30.38\%
 \end{aligned}$$

Samples	AQE (%)
MoS <sub>2</sub>	0
CdS	0.44
ZnIn <sub>2</sub> S <sub>4</sub>	0.78
ZIS/CdS	1.56
MoS <sub>2</sub> /CdS	1.14
ZIS/MoS <sub>2</sub>	17.21
ZIS/MoS <sub>2</sub> /CdS	30.38

**Table S3.** AQE over some ZnIn<sub>2</sub>S<sub>4</sub>-based photocatalysts in reported work in contrast with this work.
