General information

All reagents and solvents were purchased from Aldrich or Alfa Aesar and used as received without further purification. High resolution Mass spectroscopy (HRMS) was performed by the Spectropole of Aix-Marseille University. ESI mass spectral analyses were recorded with a 3200 QTRAP (Applied Biosystems SCIEX) mass spectrometer. The HRMS mass spectral analysis was performed with a QStar Elite (Applied Biosystems SCIEX) mass spectrometer. Elemental analyses were recorded with a Thermo Finnigan EA 1112 elemental analysis apparatus driven by the Eager 300 software. $^1$H and $^{13}$C NMR spectra were determined at room temperature in 5 mm o.d. tubes on a Bruker Avance 400 spectrometer of the Spectropole: $^1$H (400 MHz) and $^{13}$C (100 MHz). The $^1$H chemical shifts were referenced to the solvent peaks DMSO (2.49 ppm), CDCl$_3$ (7.26 ppm) and the $^{13}$C chemical shifts were referenced to the solvent peak DMSO (49.5 ppm), CDCl$_3$ (77.0 ppm). All photoinitiators were prepared with analytical purity up to accepted standards for new organic compounds (>98%), which were checked by high field NMR analysis.

Dissolution in a minimum of dichloromethane followed by addition of pentane precipitated a solid that was filtered off, washed several times with pentane and dried under vacuum (2.54 g, 45% yield). $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 7.78 (d, $J = 15.6$ Hz, 2H), 7.61 – 7.53 (m, 6H), 7.44 – 7.38 (m, 4H), 7.38 – 7.32 (m, 2H), 7.20 – 7.15 (m, 4H), 7.14 – 7.10 (m, 7H), 3.89 (s, $J = 2.0$ Hz, 6H); HRMS (ESI MS) m/z: theor: 566.2326 found: 566.2328 ([M+H]$^+$ detected); Anal.
