Materials and instrumentation

All reagents and starting materials were obtained commercially from Sigma-Aldrich, Acros and Merck, and were used as received without any further purification unless otherwise noted. Gas chromatographic (GC) analyses were performed using a Shimadzu GC 2010-Plus equipped with a flame ionization detector (FID) and an SPB-5 column (length = 30 m, inner diameter = 0.25 mm, and film thickness = 0.25 μm). The
temperature program for GC analysis held samples at 100 °C for 1 min; heated them from 100 to 280 °C at 40 °C/min; held them at 280 °C for 4.5 min. The GC yield was calculated using diphenyl ether as the internal standard. The $^1$H NMR and $^{13}$C NMR were recorded on Bruker AV 500 spectrometers using residual solvent peak as a reference.
