Figure S1. SEM images of oxide-derived copper with a thickness of 3C (a) before and (b) after electrochemical reduction.

Figure S2. Partial current density vs. potential (V vs RHE) of (a) C$_2$H$_4$, (b) CH$_4$, (c) CO and (d) H$_2$ as a function of varying P$_{CO2}$ in 0.1M KHCO$_3$ (see color code in Figure S2(d)). The solid lines are meant to guide the eye.
