**Synthesis of Broken C\textsubscript{23}TDI**

A mixture of NMI-Br (466 mg, 0.78 mmol), S\textsubscript{2} (PMI-Bpin) (300 mg, 0.39 mmol), Aliquat 336 (2 drops), ethanol (1 mL), and toluene (10 mL) was degassed and to was combined with Pd\textsubscript{2}(dba)\textsubscript{3} (28 mg, 31 \(\mu\)mol), Tri-tert-butyl phosphonium tetrafluoroborate (18 mg, 62 \(\mu\)mol) and a solution of \(\text{K}_2\text{PO}_4\) (402 mg, 1.95 mmol) in 1 mL deoxygenated water. The mixture was heated at 90 °C for 48 h with vigorous stirring. After cooling down to room temperature, the resulting mixture was extracted with dichloromethane (100 mL) twice, and the organic layer was dried over Na\textsubscript{2}SO\textsubscript{4}. The organic solvent was concentrated in reduced pressure to yield a red solid. The pure Broken C\textsubscript{23}TDI (360 mg, 80 %) was obtained by silica gel column chromatography (1:2 dichloromethane/hexane).

\(^1\text{H NMR}\ (500\text{ MHz, Chloroform-}d)\ \delta\ 8.80 - 8.62\ (m, 4H), 8.59\ (d, J = 7.8\ Hz, 1H), 8.53\ (d, J = 8.2\ Hz, 1H), 8.52 - 8.46\ (m, 2H), 7.84\ (m, 2H), 7.65\ (d, J = 7.7\ Hz, 1H), 7.62\ (t, J = 7.9\ Hz, 1H), 7.49\ (t, J = 7.9\ Hz, 1H), 7.42\ (d, J = 8.3\ Hz, 1H), 5.21\ (m, 2H), 2.27\ (pd, J = 11.4, 9.5, 6.3\ Hz, 4H), 1.93 - 1.78\ (m, 4H), 1.72\ (dq, J = 11.8, 6.6\ Hz, 1H), 1.61\ (dd, J = 12.1, 3.4\ Hz, 1H), 1.40 - 1.14\ (m, 70H), 0.86\ (dt, J = 11.2, 7.2\ Hz, 12H).
Broken $\text{C}_{23}\text{TDI}$ (1.9 g, 1.6 mmol) was dissolved in diglyme (15 ml), and mixed with ethanolamine (50 ml) and $\text{K}_2\text{CO}_3$ (10 g, 72 mmol). The mixture was purged with nitrogen and stirred at 150 for 6 hours. After cooling, the reaction mixture was poured over water and filtered, and the remaining solids were purified through flash chromatography (5:1 Dichloromethane: Hexanes $\rightarrow$ Dichloromethane) to produce pure $\text{C}_{23}\text{TDI}$ (1.2 g, 65%). $^1\text{H}$ NMR (500 MHz, Chloroform-$d$) $\delta$ 8.70 – 8.57 (m, 8H), 8.53 (d, $J = 8.0$ Hz, 4H), 5.25 – 5.13 (m, 2H), 2.34 – 2.18 (m, 4H), 1.86 (m, 4H), 1.39 – 1.26 (m, 8H), 1.25 – 1.11 (m, 64H), 0.82 (t, $J = 7.0$ Hz, 12H).
Steady-State Spectroscopy

**Time-Resolved Optical Spectroscopy**

Prior to kinetic analysis, the fsTA data are background/scatter-subtracted and chirp-corrected, and the visible and NIR data sets are spectrally merged (Surface Xplorer 4, Ultrafast Systems, LLC). The kinetic analysis was performed using home written programs in MATLAB\(^1\) and was based on a global fit to selected single-wavelength kinetics. The time-resolution is given as \( w = 300 \) fs (full width at half maximum, FWHM); the assumption of a uniform instrument response across the frequency domain and a fixed time-zero \((t_0)\) are implicit in global analysis. The kinetic data from multiple different wavelengths are fit using the global analysis described below. Each wavelength is given an initial amplitude that is representative of the spectral intensity at time \( t_0 \), and varied independently to fit the data. The time/rate constants and \( t_0 \) are shared between the various kinetic data and are varied globally across the kinetic data in order to fit the model(s) described below. We globally fit the dataset to a specified kinetic model and use the resultant populations to deconvolute the dataset and reconstruct species-associated spectra. We use a first-order kinetic model with rate matrix \( K \):

\[
K = \begin{pmatrix}
-k_1 & 0 & 0 \\
k_1 & -k_2 & 0 \\
0 & k_2 & k_3
\end{pmatrix}
\]  

(S1)

The MATLAB program numerically solves the differential equations through matrix methods,\(^2\) then convolutes the solutions with a Gaussian instrument response function with width \( w \) (FWHM), before employing a least-squares fitting using a Levenberg-Marquardt or Simplex method to find the parameters which result in matches to the kinetic data.

Once the fit parameters are established, they are fed directly into the differential equations, which were solved for the populations of the states in model—i.e., \( A(t) \), \( B(t) \), and \( C(t) \). Finally, the
raw data matrix (with all the raw data) is deconvoluted with the populations as functions of time to produce the spectra associated with each species.

**Figure S9:** fsTA analysis of fresh C$_{23}$TDI film. a) Kinetic data and overlaid fit at selected wavelengths, b) model population c) species-associated spectra.
Figure S10: fsTA analysis of aged $\text{C}_{23}\text{TDI}$ film. a) Kinetic data and overlaid fit at selected wavelengths, b) model population c) species-associated spectra.
Figure S11: fsTA analysis of aged C$_{23}$TDI film at various times following excitation at 540 nm.
Figure S12: fsTA analysis of aged C_{23}TDI film, excited at 540 nm. a) Kinetic data and overlaid fit at selected wavelengths, b) model population c) species-associated spectra.
