I. General remarks

1. Materials

Unless otherwise noted, diphenylamine, 4-chloro-N-phenylaniline, 4-bromo-N-phenylaniline, cyanuric chloride, n-BuLi (2.5 M in hexane), lithium diisopropylamide (LDA, 2 M in THF) and extra dry solvents (THF stored with molecular sieves) were obtained from commercial suppliers and used without further purification. 4-Fluoro-N-phenylaniline [S1] and 2-chloro-4,6-bis(diphenylamino)-1,3,5-trazine [S2] were prepared according to the literatures.

2. Instrumentation

NMR spectra were obtained on a Varian Inova 400 spectrometer. The $^1$H NMR (400 MHz) and $^{13}$C NMR (100 MHz) chemical shifts were measured relative to CDCl$_3$ as the internal reference (CDCl$_3$: $\delta$ = 7.26 ppm for $^1$H and $\delta$ = 77.16 ppm for $^{13}$C, respectively). High-resolution mass spectra (HRMS) were obtained with Waters-Q-TOF-Premier (ESI$^+$). The purities of HPM derivatives were determined by high-performance liquid chromatography (HPLC) using an Agilent 1260-DAD HPLC system. Single-crystal X-ray diffraction data for the compounds were obtained by using a New Gemini, Dual, Cu at zero, EosS2 diffractometer or a Bruker D8 venture diffractometer with Ga radiation at room temperature. Using Olex2 [S3], the structure was solved with the ShelXT [S4] structure solution program using Intrinsic Phasing and refined with the ShelXL [S5] refinement package using Least Squares minimisation. The UV-vis diffuse reflectance spectra (DRS) were obtained by SHIMADZU UV-3600 plus equipped with integrating sphere attachment. Room-temperature phosphorescence (RTP) spectra were measured using HITACHI F-7100 FL spectrophotometer (phosphorescence mode, chopping speed: 40 Hz). The RTP lifetimes were collected on a HORIBA TEMPRO-01 instrument. The phosphorescence quantum yields were determined by FLS-980 with integrating sphere systems under ambient conditions. The time-resolved RTP decay image and temperature dependent phosphorescence spectra were obtained by FLS-980. The lifetimes of temperature dependence of phosphorescence were recorded by the QM-40 spectrofluorometer employing an electric shutter, and the excitation source is a nitrogen laser ($\lambda$ = 337 nm, pulse width $\approx$ 1.5 ns, repetition rate = 11 Hz). 10 K was obtained by cycle refrigeration of liquid helium using ARS-4HW cryo equipment (Advanced Research Systems). Powder X-ray diffraction (PXRD) patterns for HPM derivatives were recorded from 5.0° to 50.0° (2$\theta$) using a Dandong DX-2700 powder diffractometer equipped with a copper target X-ray tube and a diffracted beam monochromator. Differential scanning calorimetry (DSC) analysis were measured by Mettler Toledo DSC1 under nitrogen atmosphere at heating and cooling rate of 5 °C/min.
II. Synthesis procedures

Scheme S1 Synthesis of HPM-H.

2,4,6-Tris(diphenylamino)-1,3,5-triazine (HPM-H): HPM-H was synthesized according to the literature and recrystallized from DMF [S6]. $^1$H NMR (400 MHz, CDCl$_3$): $\delta = 7.11$-$7.15$ (m, 24 H), 7.01-$7.06$ (m, 6H) ppm. $^{13}$C NMR (100 MHz, CDCl$_3$): $\delta = 165.8$, 143.6, 128.4, 127.6, 125.0 ppm. Purity: 99.90% (HPLC).

Scheme S2 Synthesis of HPM-F, HPM-Cl and HPM-Br.

2-[N,N-(4-fluorophenyl)phenylamino]-4-bis(diphenylamino)-1,3,5-trazine (HPM-F): 4-Fluoro-N-phenylaniline (374.4 mg, 2 mmol) and 10 mL dry THF were placed in a flame-dried Schlenk tube with a magnetic stir bar under a N$_2$ atmosphere. Then the solution was cooled to -20 °C and $n$-BuLi (2.5 M in hexane, 0.96 mL, 2.4 mmol) was dropped slowly into the solution. The mixture was then warmed to room temperature and 2-chloro-4,6-bis(diphenylamino)-1,3,5-trazine (899.9 mg, 2 mmol) was added. The mixture was heated at 80 °C overnight. A large amount of solid product was precipitated. The precipitation was filtered and washed with...
methanol several times. The desired product was then recrystallized from xylene and dried in vacuo to give a white solid (722 mg, 60%). $^1$H NMR (400 MHz, CDCl$_3$): $\delta = 7.10$-$7.16$ (m, 20 H), 7.03-7.07 (m, 7H), 6.76-$6.82$ (m, 2H) ppm. $^{13}$C NMR (100 MHz, CDCl$_3$): $\delta = 165.8, 165.7, 161.4, 158.9, 143.5, 143.3, 139.54, 139.51, 129.4, 129.3, 128.39, 128.36, 127.6, 127.3, 125.1, 125.0, 115.2, 115.0 ppm. HRMS (ESI$^+$): calcd. for C$_{39}$H$_{30}$FN$_6$ [M+H]$^+$ 601.2516, found 601.2516. Purity: 99.32% (HPLC).

2-[$N,N$-(4-chlorophenyl)phenylamino]-4,6-bis(diphenylamino)-1,3,5-trazine (HPM-Cl): 4-Chloro-$N$-phenylaniline (672.1 mg, 3.3 mmol) and 15 mL dry THF were placed in a flame-dried Schlenk tube with a magnetic stir bar under a N$_2$ atmosphere. Then the solution was cooled to -20 °C and LDA (2 M in THF, 1.82 mL, 3.63 mmol) was dropped slowly into the solution. The mixture was then warmed to room temperature and 2-chloro-4,6-bis(diphenylamino)-1,3,5-trazine (1.35 g, 3 mmol) was added. The mixture was heated at 80 °C overnight. A large amount of solid product was precipitated. The precipitation was filtered and washed with methanol several times. The desired product was then recrystallized from xylene and dried in vacuo to give a white solid (1.02 g, 55%). $^1$H NMR (400 MHz, CDCl$_3$): $\delta = 7.18$-$7.11$ (m, 20 H), 7.09-$7.01$ (m, 9H) ppm. $^{13}$C NMR (100 MHz, CDCl$_3$): $\delta = 165.8, 165.6, 143.5, 143.0, 142.1, 130.3, 128.8, 128.46, 128.41, 128.35, 127.6, 127.5, 125.23, 125.19 ppm. HRMS (ESI$^+$): calcd. for C$_{39}$H$_{30}$ClN$_6$ [M+H]$^+$ 617.2220, found 617.2200. Purity: 99.58% (HPLC).

2-[$N,N$-(4-bromophenyl)phenylamino]-4,6-bis(diphenylamino)-1,3,5-trazine (HPM-Br): 4-Bromo-$N$-phenylaniline (545.9 mg, 2.2 mmol) and 10 mL dry THF were placed in a flame-dried Schlenk tube with a magnetic stir bar under a N$_2$ atmosphere. Then the solution was cooled to -20 °C and LDA (2 M in THF, 1.32 mL, 2.64 mmol) was dropped slowly into the solution. The mixture was then warmed to room temperature and 2-chloro-4,6-bis(diphenylamino)-1,3,5-trazine (899.9 g, 2.0 mmol) was added. The mixture was heated at 80 °C overnight. A large amount of solid product was precipitated. The precipitation was filtered and washed with methanol several times. The desired product was then recrystallized from xylene and dried in vacuo to give a white solid (709 mg, 54%). $^1$H NMR (400 MHz, CDCl$_3$): $\delta = 7.18$-$7.11$ (m, 20 H), 7.09-$7.01$ (m, 9H) ppm. $^{13}$C NMR (100 MHz, CDCl$_3$): $\delta = 165.8, 165.5, 143.4, 143.0, 142.7, 131.3, 129.1, 128.47, 128.42, 127.6, 127.5, 125.3, 125.2, 118.2 ppm. HRMS (ESI$^+$): calcd. for C$_{39}$H$_{30}$BrN$_6$ [M+H]$^+$ 661.1715, found 661.1716. Purity: 99.63% (HPLC).

V. Theoretical calculations

The theoretical calculations were carried out by using Gaussian 16 A.03 package [S7]. To calculate the $S_0$ and $T_1$ geometries of structures in solid states, the QM/MM method with two-layer ONIOM approach based on the single-crystal data were performed. The central molecule is regarded as high layer, calculated by QM method (B3LYP/6-31G* level). Meanwhile the surrounding molecules are frozen and regarded as low layer and calculated by MM method (UFF, embed QEq charge). The basis set superposition error (BSSE) corrected complexation energies ($\Delta E_c$) of trimers of HPM derivatives were calculated to estimate the strength of noncovalent intermolecular interactions with functional and basis set of B3LYP-D3(BJ)/6-311+G(d,p). The molecular coordinates of HPM trimers were obtained from the single-crystal data, while the hydrogen and halogen atoms were optimized with B3LYP-D3(BJ)/6-311G(d,p) method. The geometry changes between $S_0$ and $T_1$ states are measured by root-mean squared displacement (RMSD) with the expression of

$$\text{RMSD}=\sqrt{\frac{1}{N} \sum_{i=1}^{N} \left[ (x_i-x'_i)^2 + (y_i-y'_i)^2 + (z_i-z'_i)^2 \right]}.$$ 

The reorganization energy ($\Delta E_r$) was calculated by MOMAP program [S8] to measure the non-radiative energy consumption based on the obtained electronic structure and vibration information. The total volume ($V_{\text{total}}$), free volume ($V_{\text{free}}$) were calculated by Multiwfn 3.8 based on the single-crystal unit cells data.
