**General.** All air-sensitive reactions were performed under a nitrogen atmosphere using standard Schlenck techniques. CH$_2$Cl$_2$ was distilled from CaH$_2$, Et$_2$O from sodium/benzophenone, and MeOH from Mg(OEt)$_2$ prior to use. Other solvents and all standard reagents were purchased and used as received. $^1$H and $^{13}$C($^1$H) NMR spectra were recorded at 300 MHz and 75 MHz, respectively, on a Varian 300 spectrometer operating at 298 K. If the signals were detected, they are denoted by (b). UV/Vis spectra were recorded on a Cary 50 scan UV-visible spectrophotometer and solid state UV/Vis spectra were recorded on a Varian Cary 5 UV-Vis-NIR spectrophotometer. Elemental microanalyses were performed by Dornis und Kolbe, Mikroanalytisches Laboratorium, Müllheim a/d Ruhr, Germany.

1,4-dibenzyl-1,2,3-triazole (L2)

Benzylazide (2.0 g, 15 mmol) was dissolved in acetonitrile. Next, 2,6-lutidine (1.2 mL, 10 mmol) was added, followed by 3-phenyl-propyne (1.25 mL, 10 mmol). Finally, Cu(CH$_3$CN)$_4$PF$_6$ (48 mg, 0.013 mmol) was added. After stirring for 24 hours at room temperature, the mixture was concentrated in vacuo and washed with Et$_2$O to yield a slightly pink solid. The solid was taken up in CH$_2$Cl$_2$ (20 mL) and washed with ammonia solution (2 x 20 mL) to remove Cu$^{2+}$ salts. The organic layer was dried (MgSO$_4$), filtered and concentrated to dryness to afford L2 as a white solid (1.73 g, 65%). $^1$H NMR (acetone-$d_6$, 298 K): $\delta = 7.69$ (s, 1H, triazole-$H$), 7.33 (m, 5H, Ar$H$), 7.16 (m, 5H, Ar$H$), 5.57 (s, 2H, NCH$_2$), 4.01 (s, 2H, ArCH$_2$) ppm; Anal. calcd. for C$_{16}$H$_{15}$N$_3$: C 77.08, H 6.06, N 16.85%; found: C 76.92, H 6.15, N 16.75%.

1,4-dihexyl-1,2,3-triazole (L3)

This reaction was carried out under a N$_2$ atmosphere. Hexylazide (2.0 g, 23 mmol) was dissolved in 25 mL of acetonitrile. Next, 2,6-lutidine (1.86 mL, 16 mmol) was
added, followed by 1-octyne (2.33 mL, 16 mmol). Finally, Cu(CH₃CN)₄PF₆ (77 mg, 0.021 mmol) was added. After stirring for 24 hours at room temperature, the mixture was concentrated in vacuo, yielding a white solid. The product was purified by column chromatography. Remains of 2,6-lutidine were removed by washing with hexane (30 mL) whereas 1,4-dihexyl-1,2,3-triazole was eluted with CH₂Cl₂. All the fractions containing the product were combined and concentrated in vacuo. The product was obtained as a blue oily substance, which was taken up in CH₂Cl₂ (20 mL) and washed with ammonia solution (2 × 20 mL) to remove Cu²⁺ salts. The organic layer was dried (MgSO₄), filtered and concentrated to dryness to afford L₃ as a white solid (1.19 g, 31%).

Determination of $K_{\text{eq}}$.

2L1 and 1.1-1.3 eq. of Lx were weighed in an NMR tube and dissolved in 500 µL of boiling acetone-$d_6$. After equilibration of the mixture (as inferred from three identical, consecutive $^1H$ NMR spectra), the equilibrium concentrations of all compounds were determined by the average of two independent integrations of the appropriate signals. In all cases, at least one signal of each of the components of the equilibrium mixture was independent in the spectrum and could thus be reliably integrated. Figure S1 shows a representative example.
