General Methods: All reagents were used as received. Column chromatography was performed using silica gel (60 Å, 230–400 mesh, ICN Biomedicals GmbH, Eschwege, Germany). Analytical thin-layer chromatography was performed using 250 μm silica (Analtech, Inc., Newark, DE).

$^1$H NMR and $^{13}$C NMR spectra were recorded at 250.13 and 62.89 MHz, respectively. Chemical shifts for $^1$H NMR and $^{13}$C NMR spectra were referenced to TMS and measured with respect to the residual protons in the deuterated solvents. Microanalysis was performed by Atlantic Microlab, Inc. Norcross, Georgia.

Typical reaction procedure: Finely ground 4-chlorobenzaldehyde (210 mg, 1.5 mmol), allyltrimethylsilane (256 mg, 2.25 mmol) and dry hexanes (16 mL) were placed in a dry argon-flushed, 50 mL round-bottomed flask equipped with a magnetic stirring bar. The solution was cooled to 0 °C, and boron trichloride (1.65 mmol, 1.65 mL of a 1.0 M CH$_2$Cl$_2$ solution) was added via syringe. After completion of the addition, the ice-bath was removed and the resulting solution was allowed to warm to room temperature. The reaction mixture was hydrolyzed with water and extracted
with hexanes. The organic layer was separated, dried over anhydrous MgSO₄, the solvent removed under reduced pressure, and the product isolated by flash column chromatography.
