Figure S1. Two views (with 30% thermal ellipsoids) of the ‘bent’ carbonyl ligand in the crystal structure of [Co$_3$(µ$_3$-CH)(CO)$_4$(µ-1,2-DIPAMP)] (12) highlighting: (i) the shortest intermolecular distances between the carbonyl O-atom (OC7) and the H-atoms attached to C28 of the DIAMP ligand on the neighbouring cluster; and (ii) that the larger axes of the elongated thermal ellipsoids of the carbonyl C- and O-atoms are almost orthogonally aligned (indicating disorder of the carbonyl is not responsible for the observed bending).
