Figure S1: MS-spectrum of $\text{H}_4\text{DO3ASH}$ (positive mode).
The labeling yield decreases to 85% - 90% when the reactions are carried out at pH < 6 and pH > 7, being these yields only achieved after at least 4h at room temperature. Figure S2 shows the pH dependence in the labelling of H₄do3aSH with $^{153}$Sm at pH 5, 6 and 9 (30 min reaction, room temperature) and figure S3 represents the kinetics of formation of $^{153}$Sm-do3aSH at pH 5 and at pH 9, both at room temperature.

**Figure S2:** pH dependence in the labeling of do3aSH with $^{153}$Sm (30 min., room temperature): X $^{153}$Sm(NO₃)₃, $^{153}$Sm-do3aSH.

**Figure S3:** Kinetics of the labelling reaction at: (a) pH 5 and (b) pH 9 (room temperature): X $^{153}$Sm(NO₃)₃, $^{153}$Sm-do3aSH.
**Figure S4:** $^{166}\text{Ho-DO3ASH}$ chromatographic profile: **A:** after labelling, **B:** in human serum, after 2 days, **C:** in human serum, after 3 days.
