1. Instruments

The X-ray Photoelectron Spectroscopy (XPS) was performed using a Thermo ESCALAB250. The thermogravimetric analysis (TGA) was performed using a Netzch Sta 449c thermal analyzer system at the heating rate of 10 °C/min in air or N₂ atmosphere. The Inductive Coupled Plasma (ICP) analysis was measured using a Perkin Elmer Optima 3300DV. The Elemental analysis (for C, H, N) were measured using a Perkin Elmer 2400 Series II CHNS/O Analyzer. The FTIR spectra were measured using a Nicolet Impact 410 Fourier transform infrared spectrometer. The nitrogen adsorption isotherms were measured on a Quanta Autosorb-1c analyzer. The XRD was performed by a Rigaku D/max 2500 diffractometer using CuKα radiation, 40 kV, 200 mA with scanning rate of 0.3° min⁻¹ (20). Scanning electron microscopy (SEM) was recorded using a JEOL JEM 6700. Transmission electron microscopy (TEM) was recorded using a JEOL JEM 3010. The solid-state $^{13}$C NMR was performed by a Bruker Avance 400MHz Solid-State NMR Spectrometer.

2. Materials

All starting materials were purchased from commercial suppliers and used without further purification unless otherwise noted. The anhydrous ZnCl₂ was purchased from Aldrich and used in glove box. The Tetrakis (4-cyanophenyl) silican was prepared according to the previously reported method.[1]

3. Synthetic Procedures

Synthesis of PAF-16: General synthesis procedure: The monomer and the metal salt were transferred into a Pyrex ampoule (3*4 cm) in the glove box. The ampoule was evacuated, sealed and heated to 400 °C (PAF-16-1, PAF-16-2, PAF-16-3) and 600 °C (PAF-16-4) for 40 h (table 1). When the ampoule was cooled down to room temperature, the ampoule was opened carefully. The black block was stirred in the fresh water for 48 h three times to remove ZnCl₂. Further stirring in diluted HCl for 24 h was performed to purify the product. PAF-16 was isolated as a black rock in 76% yield.
