Fig. S2: Section of the $^{13}$C–$^1$H HSQC spectrum of 4b in CD$_2$Cl$_2$ at 21 °C using a 400 MHz spectrometer. Metal coordinated carbons (labelled B) are shifted to higher field compared to their non-coordinated counterparts (labelled A).

Fig. S3: Section of the $^{13}$C–$^1$H HMBC spectrum of 4b in CD$_2$Cl$_2$ at 21 °C using a 400 MHz spectrometer.
Fig. S4: Section of the $^1$H-NOESY spectrum of 4b in CD$_2$Cl$_2$ at −50 °C. Positive NOE correlations are shown in red; exchange was not observed at this temperature. The spectrum was acquired with 2048 × 512 data points and a spectral width of 9 ppm using a 500 MHz spectrometer with a mixing time of 500 ms.

Fig. S5: Structure of 4a based on NOE correlations in the $^1$H-NOESY NMR. The $\eta^1$ ligand is coined A, the $\eta^1,\eta^5$-(σ-P, π-arene) ligand is coined B. Selected NOE contacts: H18$^A$–H18$^B$, H13$^a$–OCH$_3$$_B$, H3$^a$–H13$^A$, H14$^B$–H13$^B$, H18$^A$–H18$^B$, H18$^B$–H18$^B$. 
**Fig. S6**: Dynamic behaviour observed in solution for 4b (arrows). The η¹ ligand is labelled A, the η¹,η⁶-(σ-P, π-arene) ligand is labelled B. Selected NOE contacts: H13'B–OCH₃, H3'B–H13'B, H3'B–H13'A, H4'B–H8'A, H18'B–H18'B, H18'A–H18'A, H13'A–H6'B.

The Eyring equation relates the rate constant $k$ and the activation free energy $\Delta G^\ddagger$. The most common form of the Eyring equation is:

$$k = \frac{\kappa T}{h} \cdot e^{-\Delta G^\ddagger/RT}$$

(1)

where $\kappa$ is the Boltzmann constant, $h$ is Planck’s constant, $T$ is the temperature in Kelvin and $R$ is the universal gas constant. The equation can be rewritten as:

$$\Delta G^\ddagger = -\ln \left( \frac{k h}{\kappa T} \right) RT$$

2 Experimental Procedures and Analytical Data

2.1 General Considerations

All air and/or water sensitive reactions were performed under a nitrogen atmosphere using standard Schlenk line techniques. Tetrahydrofuran and dichloromethane were dried over sodium/benzophenone and calcium hydride respectively, and distilled prior to use. MOP-phosphonite ligands 2a,b were synthesised according to literature procedures. All other chemicals were used as purchased without further purification.

2.2 Chemical Analysis

General Procedures. Infrared spectra were recorded on a Varian 800 FT-IR spectrometer. Mass spectrometry was carried out by the EPSRC National Mass Spectrometry Service Centre Swansea. Analytical high performance liquid chromatography (HPLC) was performed on a Varian Pro Star HPLC equipped with a variable wavelength detector.

X-ray Diffraction. All data were collected on an Oxford Diffraction Gemini A Ultra diffractometer at 150 K, using Mo Kα (λ = 0.71073 Å; 3a and 6a), or Cu Kα (λ = 1.54178 Å; 4b) radiation. Semi-empirical absorption corrections were applied based on symmetry-equivalent and repeated reflections. Structures were solved by direct methods and refined on all unique $F^2$ values, with anisotropic non-H atoms and constrained riding isotropic H atoms. CrysAlisPro software was used for data collection, integration, and absorption corrections. Structure solution, refinement, and graphics were made with the SHELXTL program. The disordered dichloromethane solvent molecule in the asymmetric unit of 6a was treated using the PLATON/SQUEEZE routine. A summary of key crystallographic experimental information is provided in Table S2.

NMR Spectroscopy. $^1$H NMR, $^{11}$B{$^1$H} NMR, $^{13}$C{$^1$H} NMR, $^{19}$F NMR, and $^{31}$P{$^1$H} NMR spectra were recorded on a JEOL Lambda 500 ($^1$H 500.16 MHz) or JEOL ECS-400 ($^1$H 399.78 MHz) spectrometer at room temperature (21°C) if not otherwise stated, using the indicated solvent as internal reference. Two-dimensional NMR experiments (COSY, NOESY, HSQC, HMBC) were used for the assignment of proton and carbon resonances; the labelling scheme is shown in Fig. S8. Full range NOESY spectra were acquired with 512 × 1024 data points and a spectral width of 9.0 ppm; mixing times were chosen between 10 and 500 ms. For the measurement of exchange rate constants in 4a,b the proton resonances of the methoxy group were used. Peak volumes were determined manually from the NOESY spectrum using MestReNova 8, and the rate constants were calculated with an estimated error of 10% using EXSYCalc.

2.5  [Rh(2a)₂]BF₄ (4a)

Method A: 2a (30 mg, 50 μmol) and [Rh(η⁴-cod)₂]BF₄ (10 mg, 25 μmol) were dissolved in dichloromethane (1 mL) and stirred for 30 minutes. The solution was filtered and layered with diethyl ether to precipitate the product as a yellow solid overnight.

Method B: 3a (21 mg, 25 μmol) was dissolved in dichloromethane (1 mL), AgBF₄ (4.8 mg, 25 μmol) and 2a (15 mg, 25 μmol) were then added and stirred for 30 minutes. The solution was filtered and concentrated in vacuo. The crude product was washed with diethyl ether to give the product as a yellow solid.

2.11 Asymmetric Addition of Phenylboronic Acid to 1-Naphthaldehyde

[Rh(acac)(η²-C₂H₄)₂] (2.6 mg, 10 μmol) and ligand 2a (12 mg, 20 μmol) were dissolved in THF (4 mL) and left to stir for 20 minutes. Phenylboronic acid (122 mg, 1.0 mmol), base (2.5 M aqueous solution, 1.0 mmol) and 1-naphthaldehyde (68 μl, 0.5 mmol) were added subsequently. The reaction mixture was heated to 60 °C and the conversion was followed by TLC analysis. After 8 hours reaction time the solvent was evaporated and the crude product was purified by column chromatography (hexane/EtOAc, 10:1) on silica media (h = 15 cm, d = 2 cm) to give the product as a colourless oil; 85% yield, 34% ee (R). The enantiomeric excess was measured by chiral HPLC (Column Daicel Chiralpak OD; flow rate: 1.0 mL/min; hexane/2-propanol, 80:20; retention times: (S) t₁ = 10.1 min, (R) t₂ = 19.4 min).7
